

Photon (Re)Construction Kit

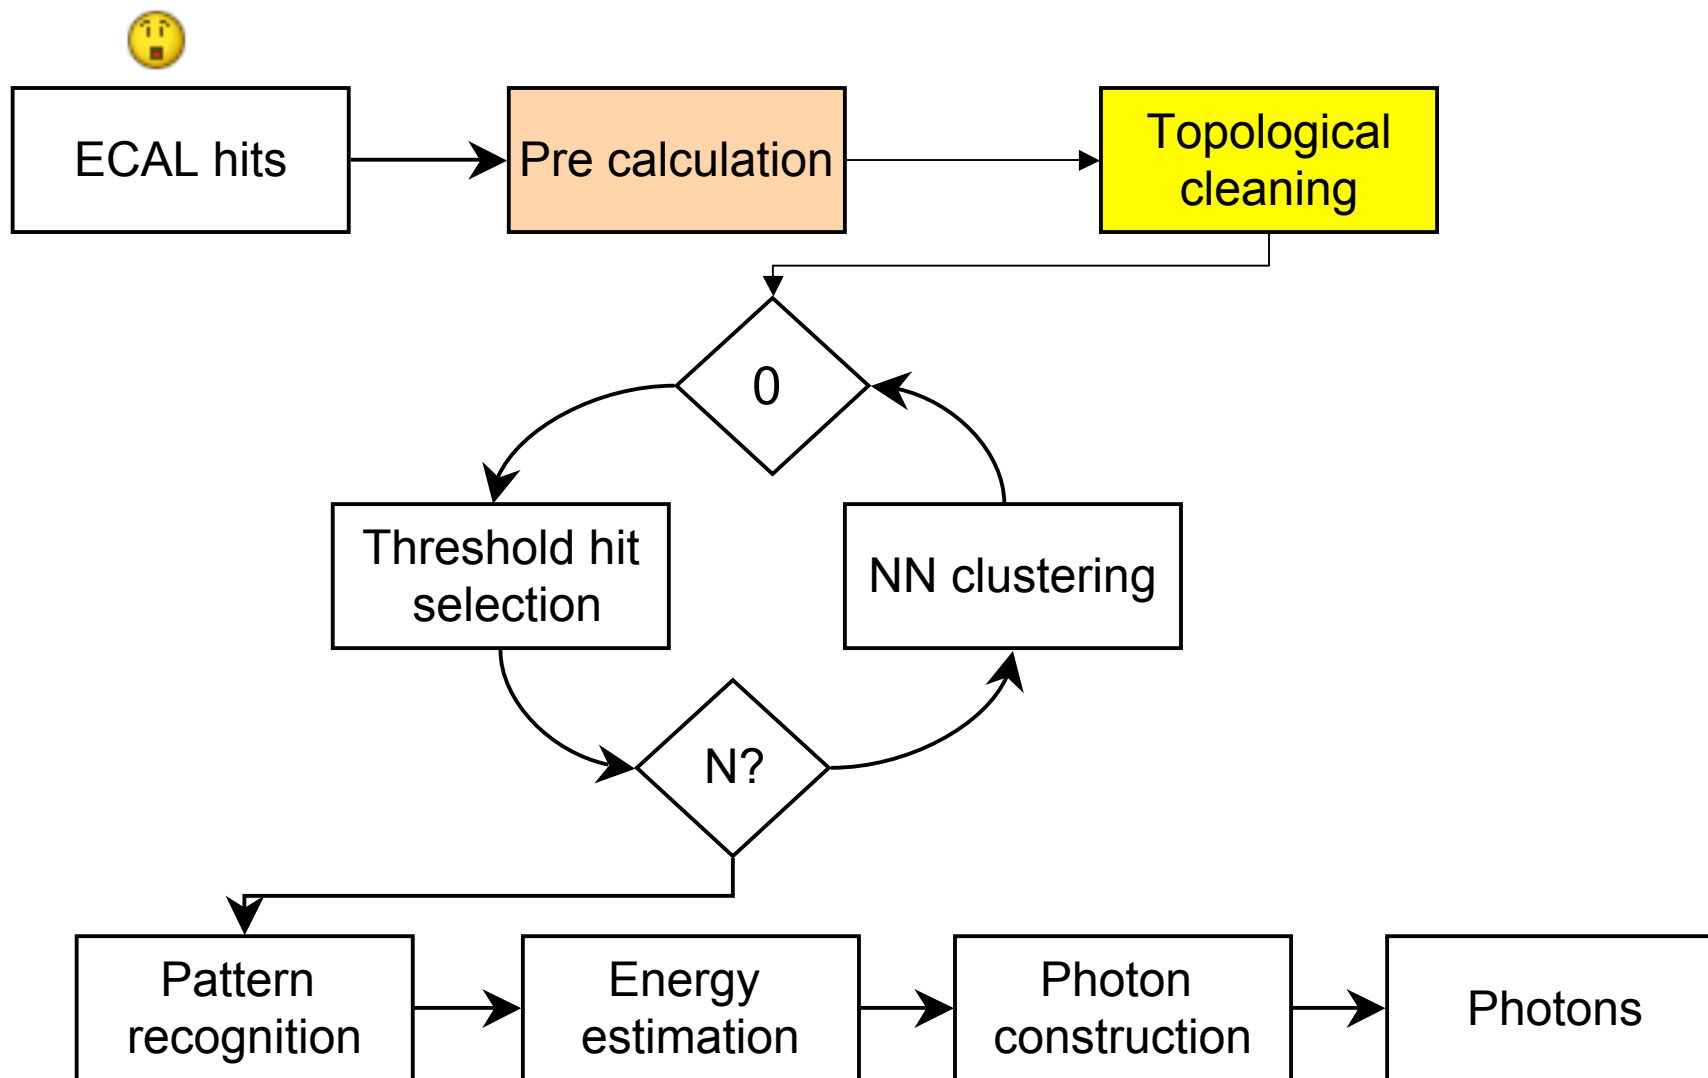

3D photon shower profile

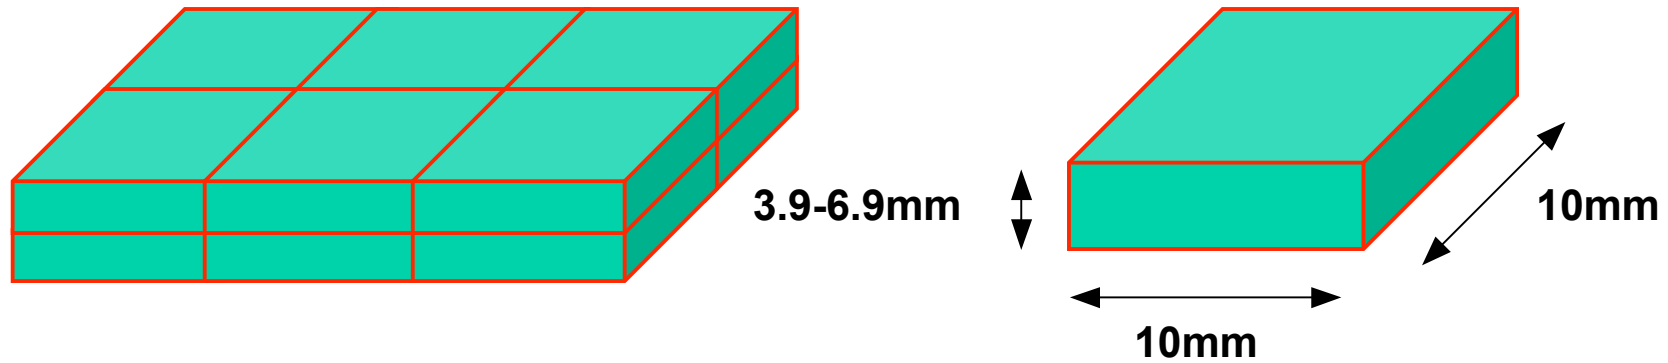

Integral over the ring with $dr = \text{cell size (10mm)}$ for photon shower profile, left single 10 GeV photon, right 10 GeV and 4 GeV photon

- Idea – have same procedure for reconstruction of photons in single and multiple photon cases
- Based on 3D shower model and imaging calorimeter
- Inverse engineering – from pattern extract parameters to construct a “photon” model
- Fly through the algorithm
- Some results - a bit for anyone taste
- How to use and where to find
- CCC (conclusion , congratulations and complains)

 Technical step not essential  optional  Can't work without

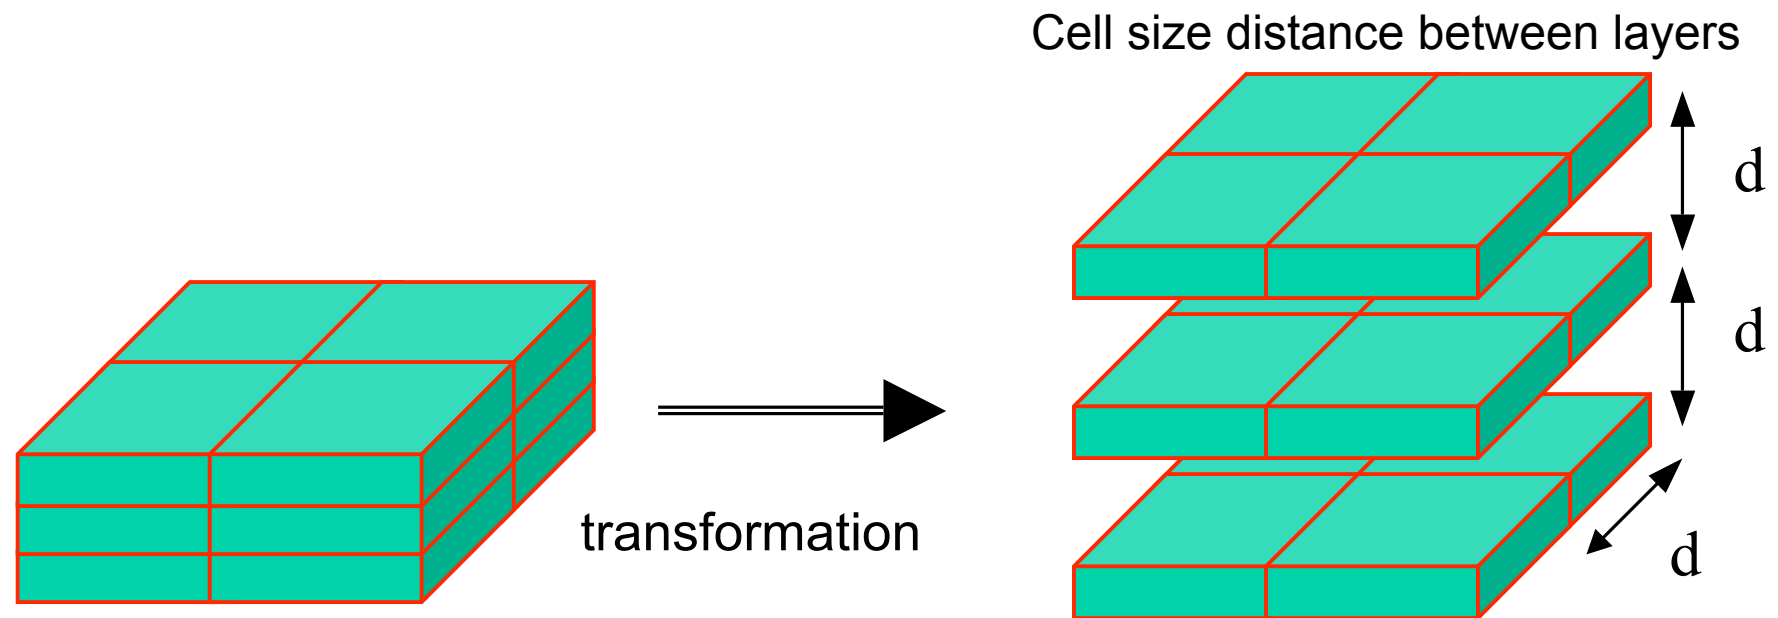

Isotropic in ijk non isotropic xyz

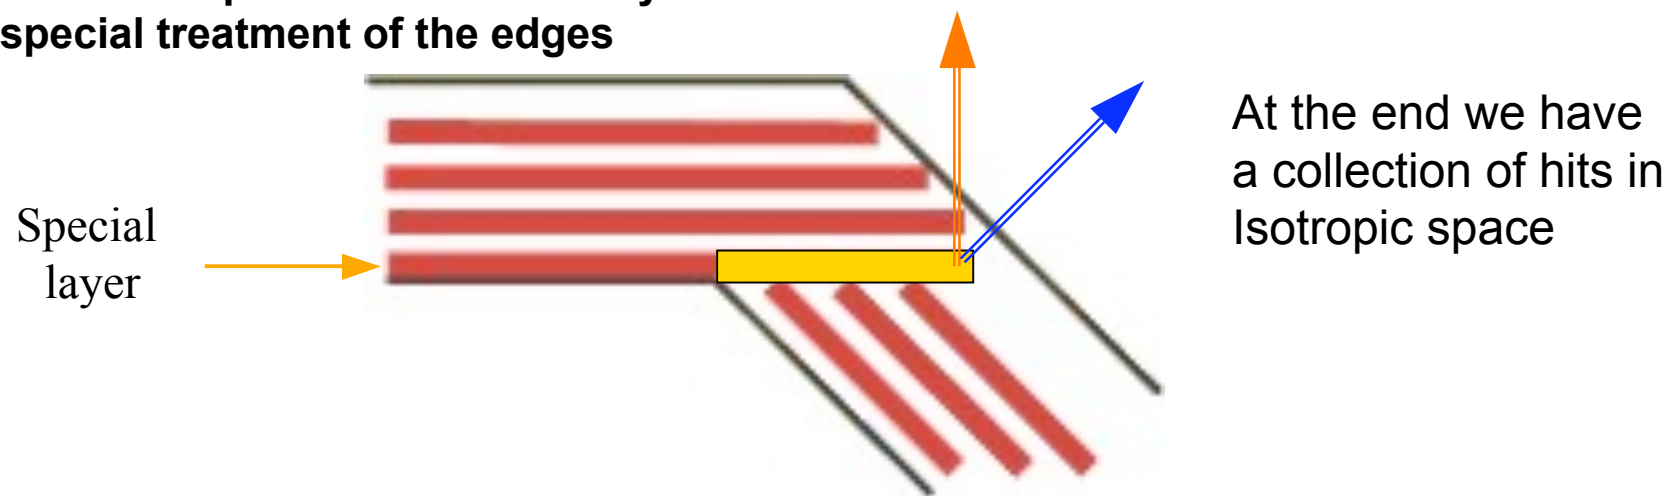

Since there is no geometry package to have a Nearest Neighbor (NN) in ijk we Transform to isotropic space

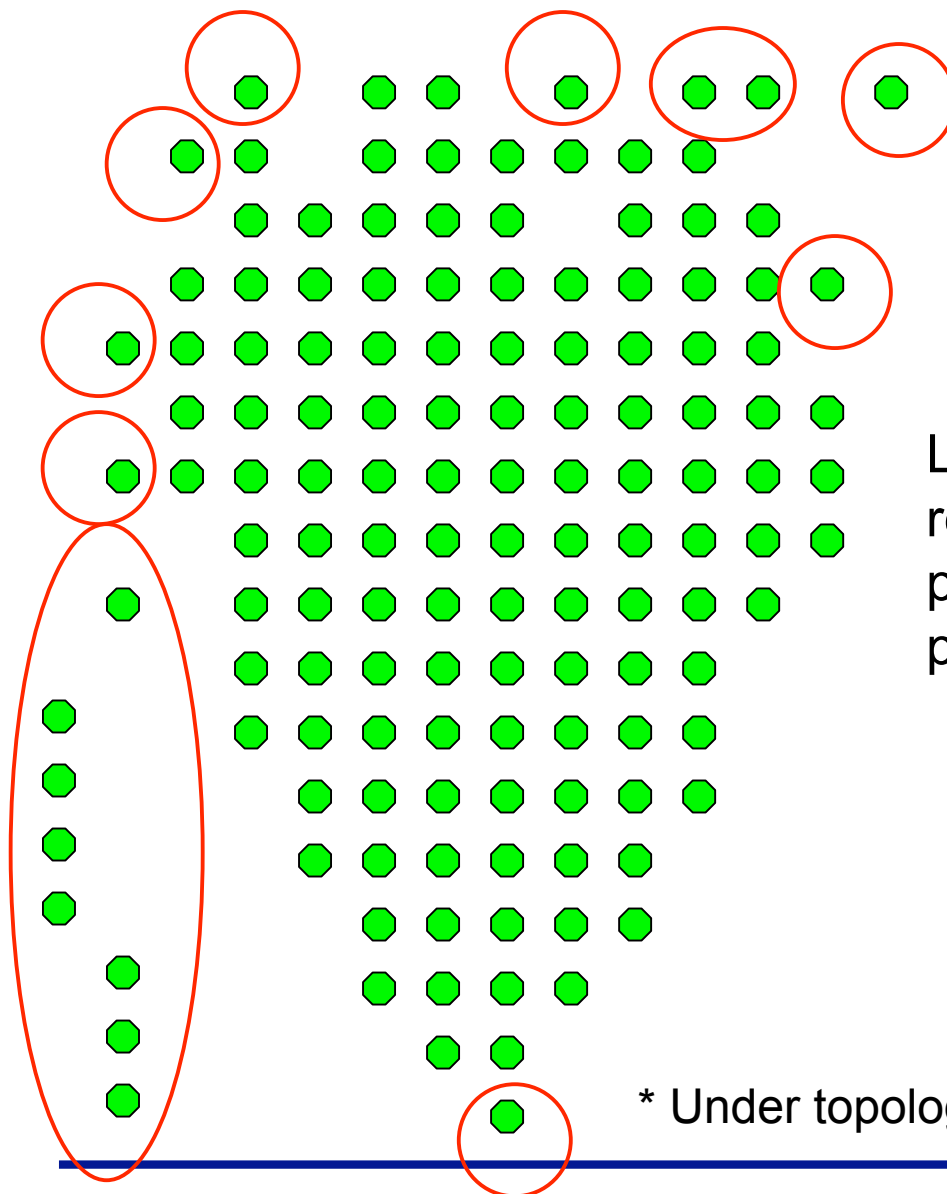

xy section of ECAL

In order to preserve connectivity
special treatment of the edges

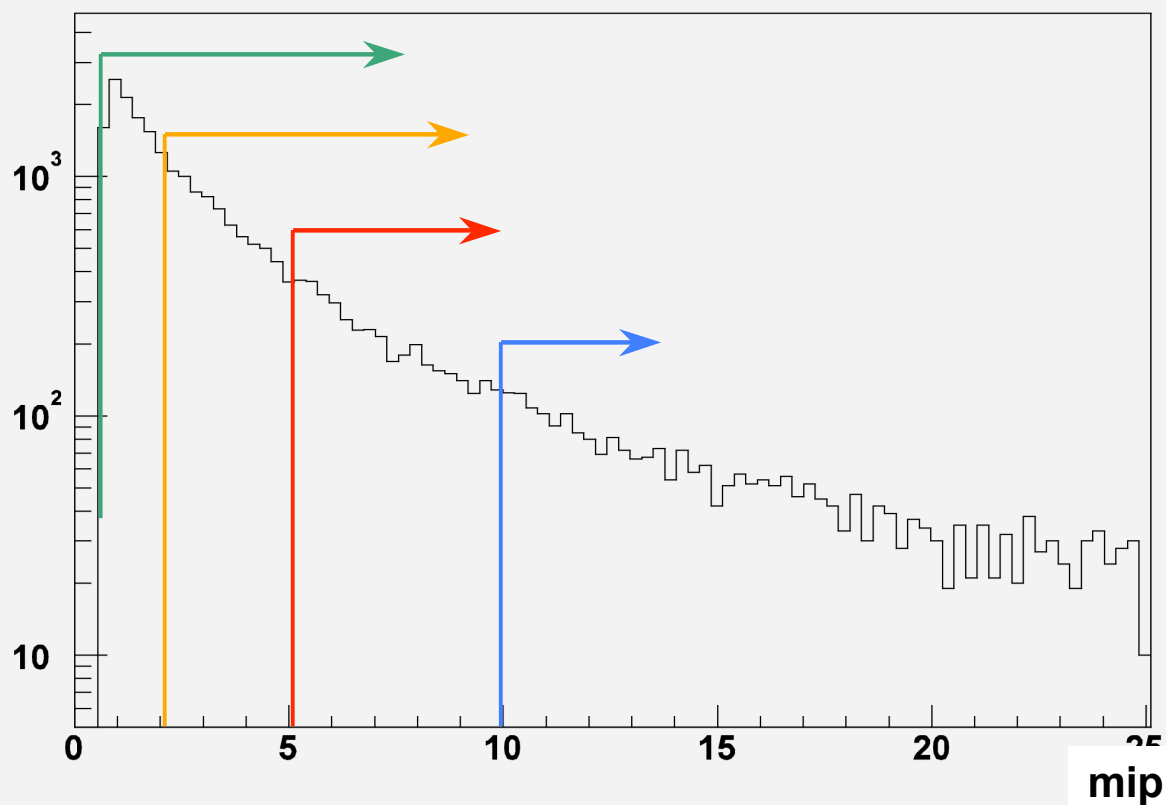

Hits are divided
Into two classes
 $N_{\text{neighbors}} \leq X$
and $N_{\text{neighbors}} > X$
(at the moment $X=4$)

Low topology* hits are then
removed from further steps of
procedure till the final one
photon construction

* Under topology one means number of neighbors

Choose
N thresholds
(N=10 at the moment)
and get N sets of hits

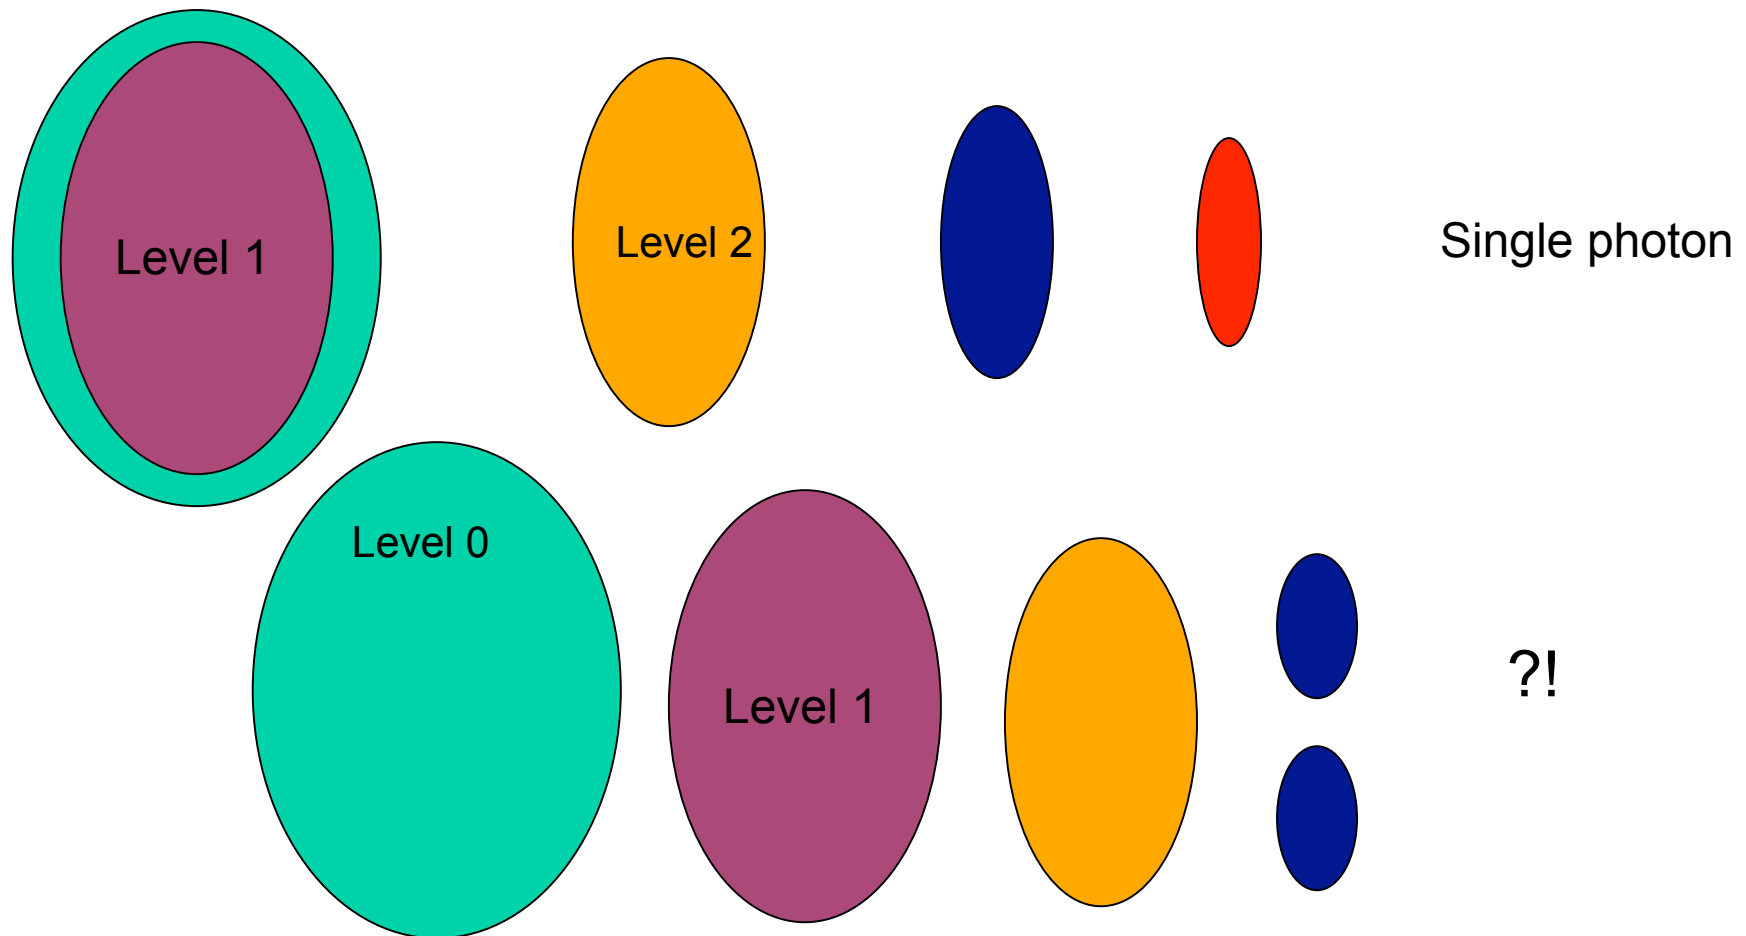

For each set do a
NN clustering
Only in particular
set!!

- Exponential distribution of the energy in hits
- don't forget that full energy range of the photons is from detection threshold till CMS Energy/2.0

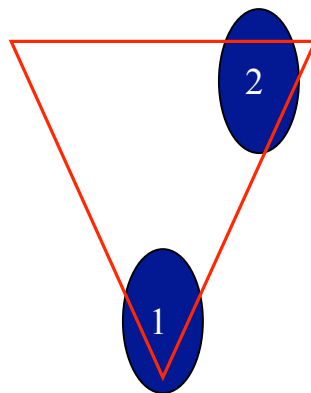

At this stage you have set of NN clusters for different thresholds

What would one expect in case of no fluctuation

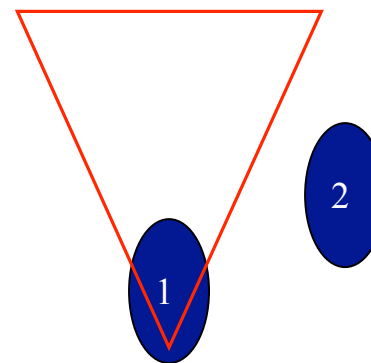

Decision when to split
on size
on position

No split

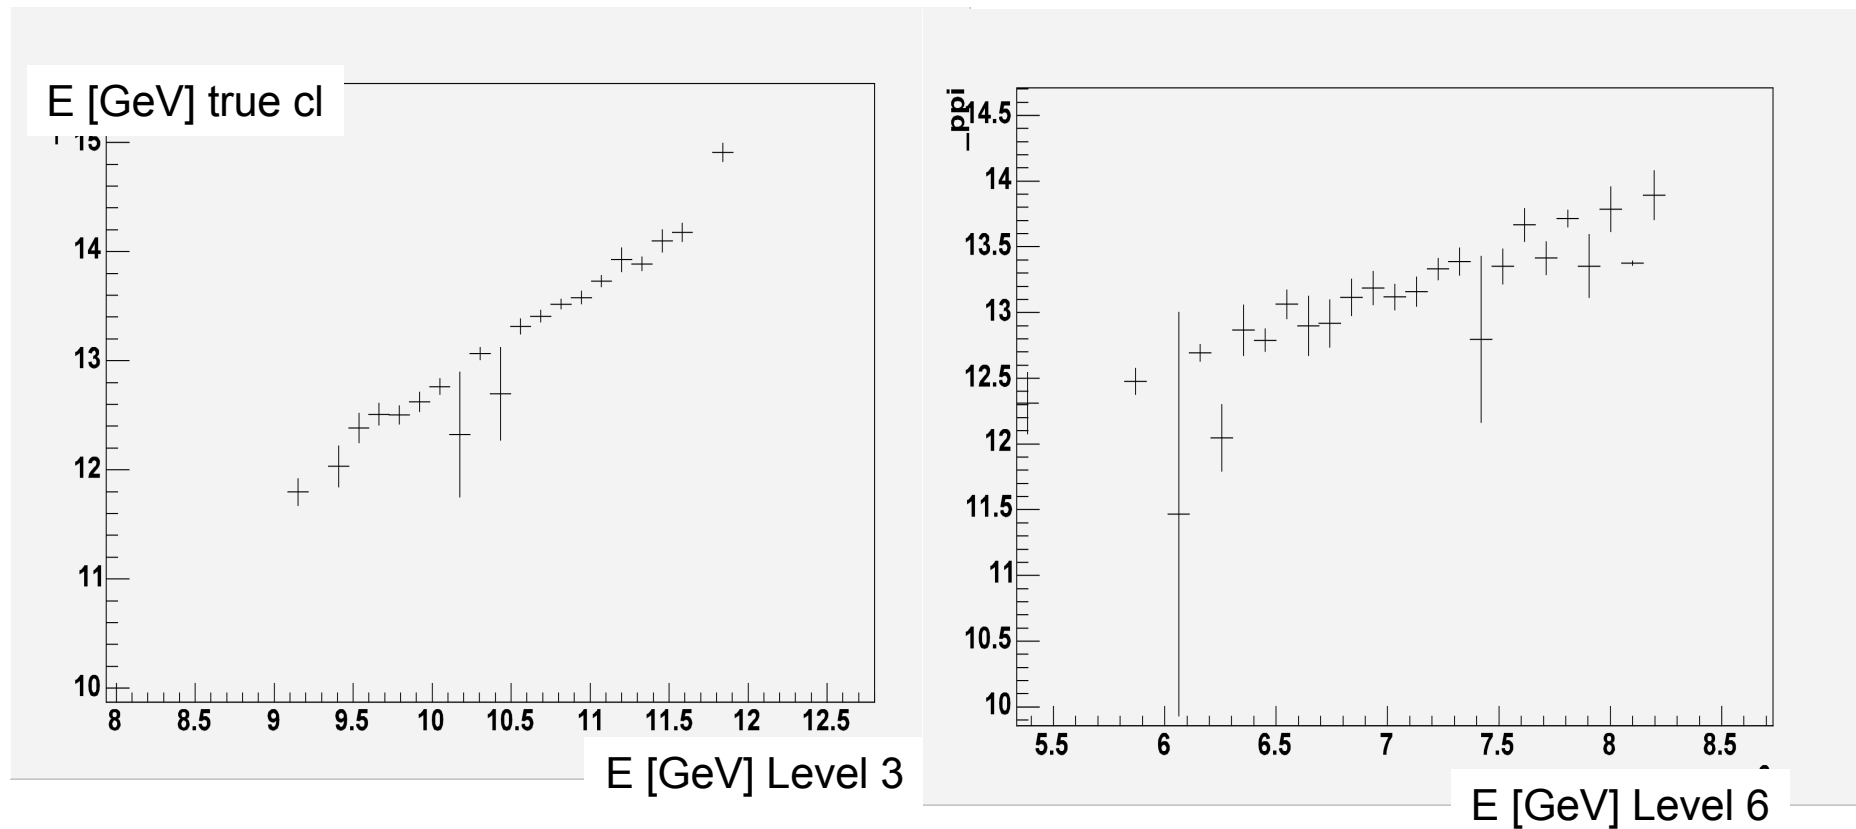

Split

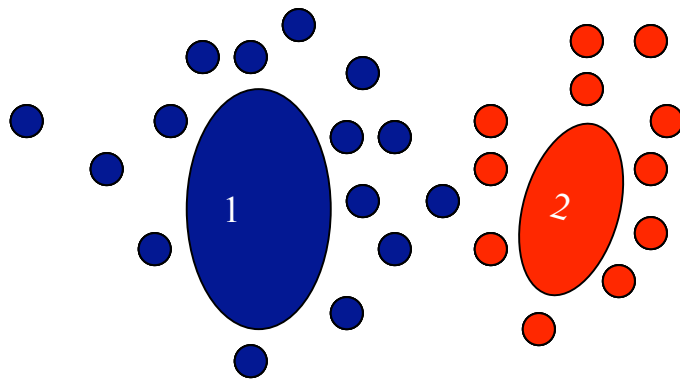

“Split” means that each of the clusters is now considered as a photon core

At the end of procedure we have a set of clusters with their level that are considered core candidates

- Energy estimation in terms of algorithm means procedure to get an estimate of incoming photon energy based on the core energy and the cluster level
- linear parameterization was chosen as appropriate

- At this stage you have a set of Energies, directions and starting points
- now it's possible to apply full 3D model for the photon
- now we take into account all the hits !! (irrespective of number of neighbors)
- material parameters for the model must be provided from geometry package

- spread the probabilities for first
- spread the probabilities for second
- if more than one contribution in hit pick the larger one
- now assign

Event generation and selection

Model - LDC00_02ScP – same as one from the central database if you exchange vtx to cylindrical one.

Generation - single photons - particle gun - uniform smearing over theta phi

List - QGSP

Event selection – to suppress events with conversion in any part of detector before calorimeter only events with photon ending in ECAL are considered

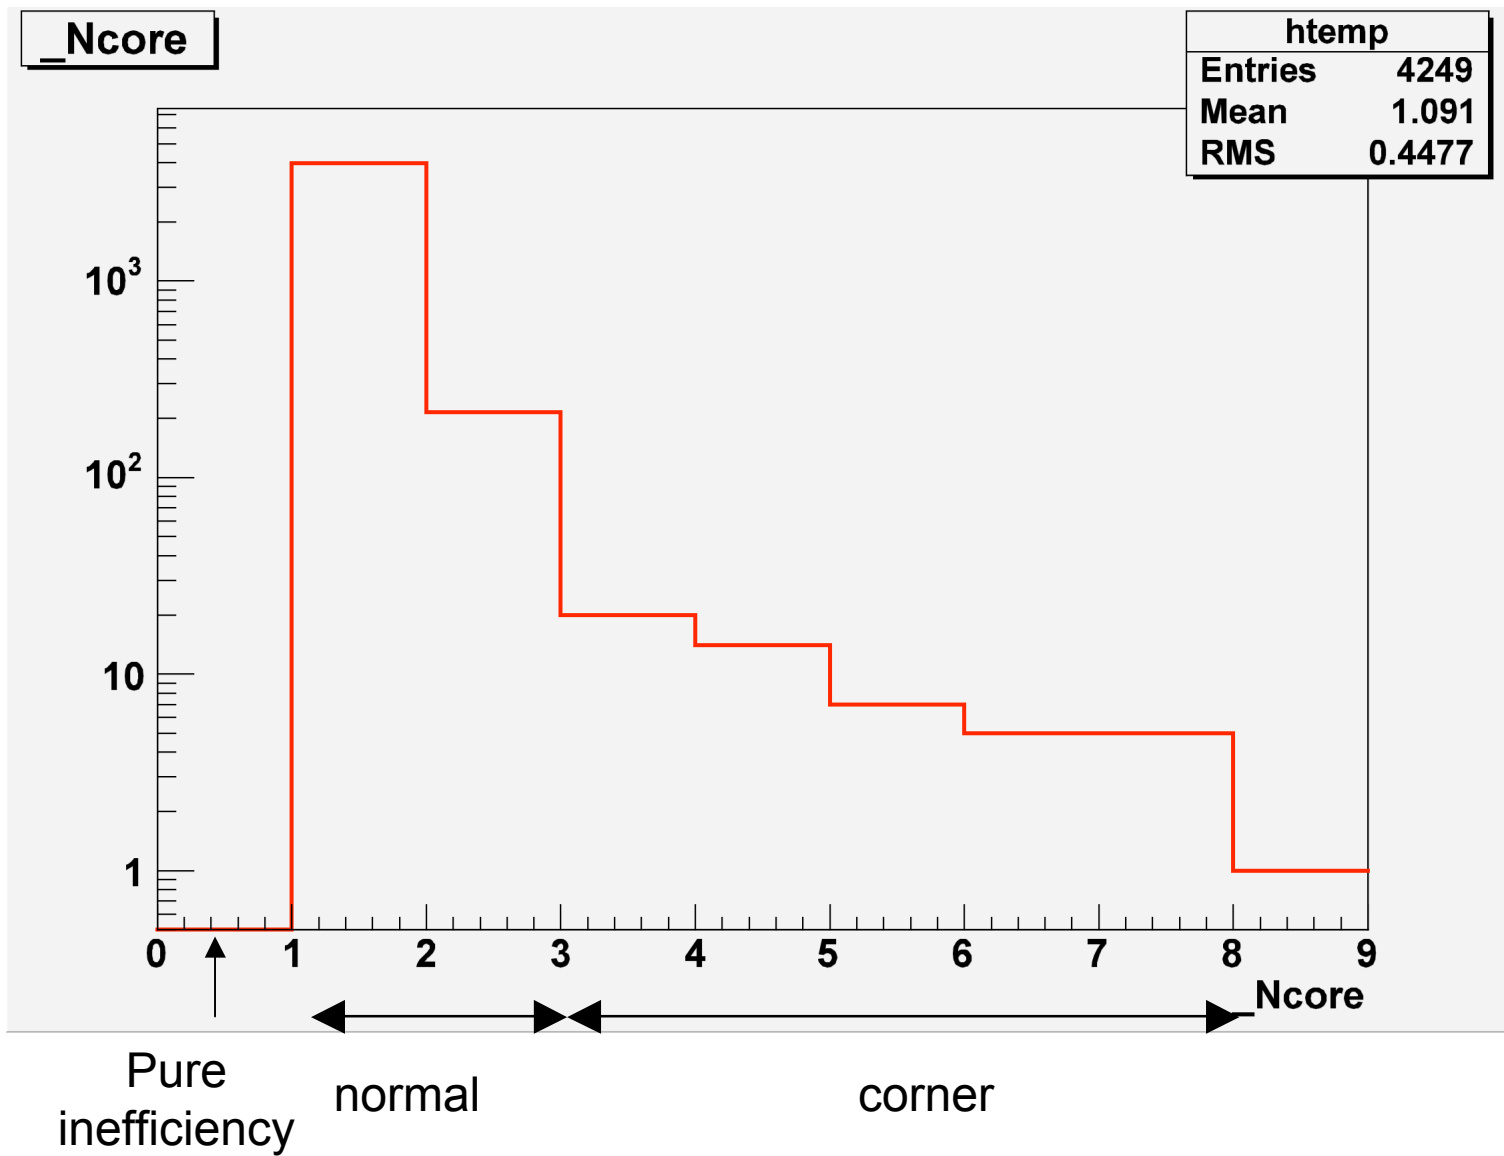

5000 events at 1,3,5,9 and 16GeV = 4200 left !!! Please no more material !*

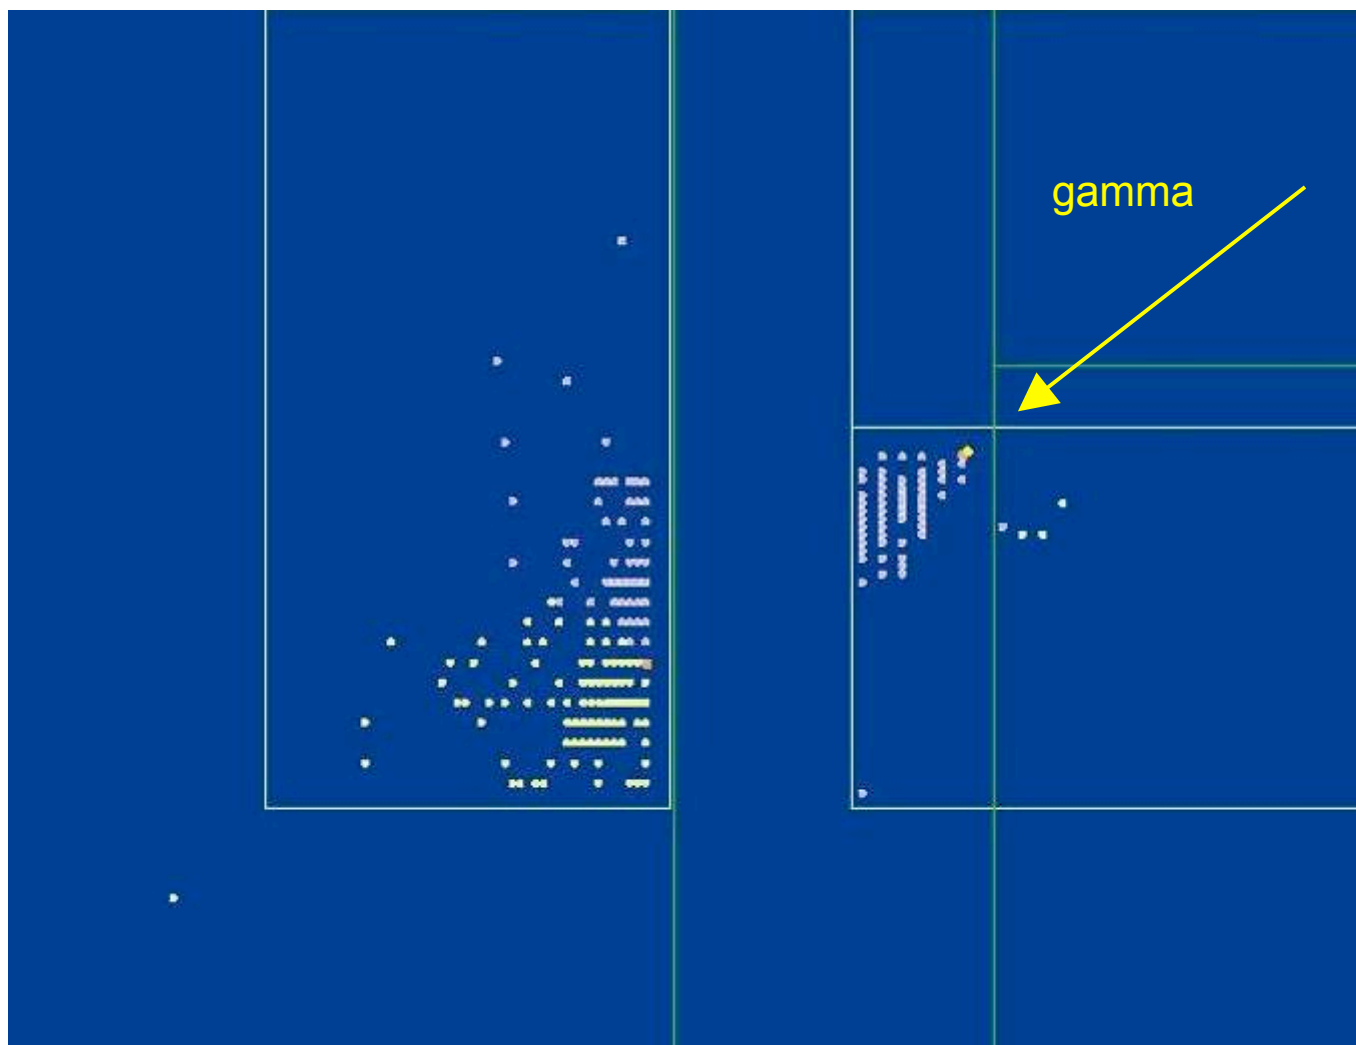

3 step procedure

find cores =>	Ncore =>	x	=>	photons	=>	x
	Ncore =>	fake suppression	=>	photons	=>	x
	Ncore =>	fake suppression	=>	photons	=>	quality check

* For SILC only ☺

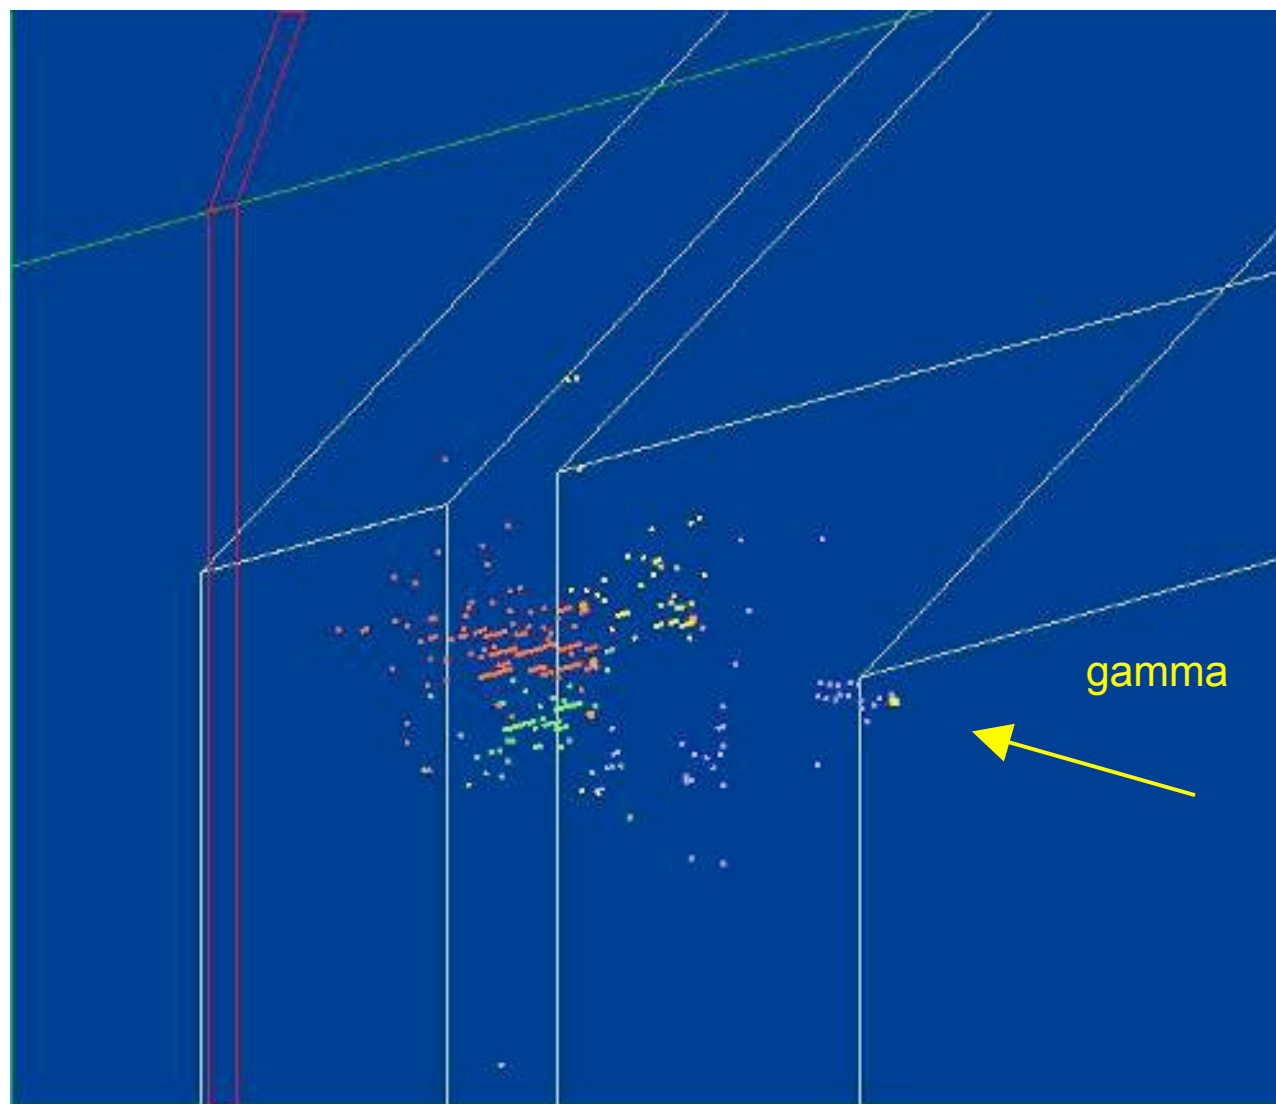

User task!

Corner 1

1 to 2

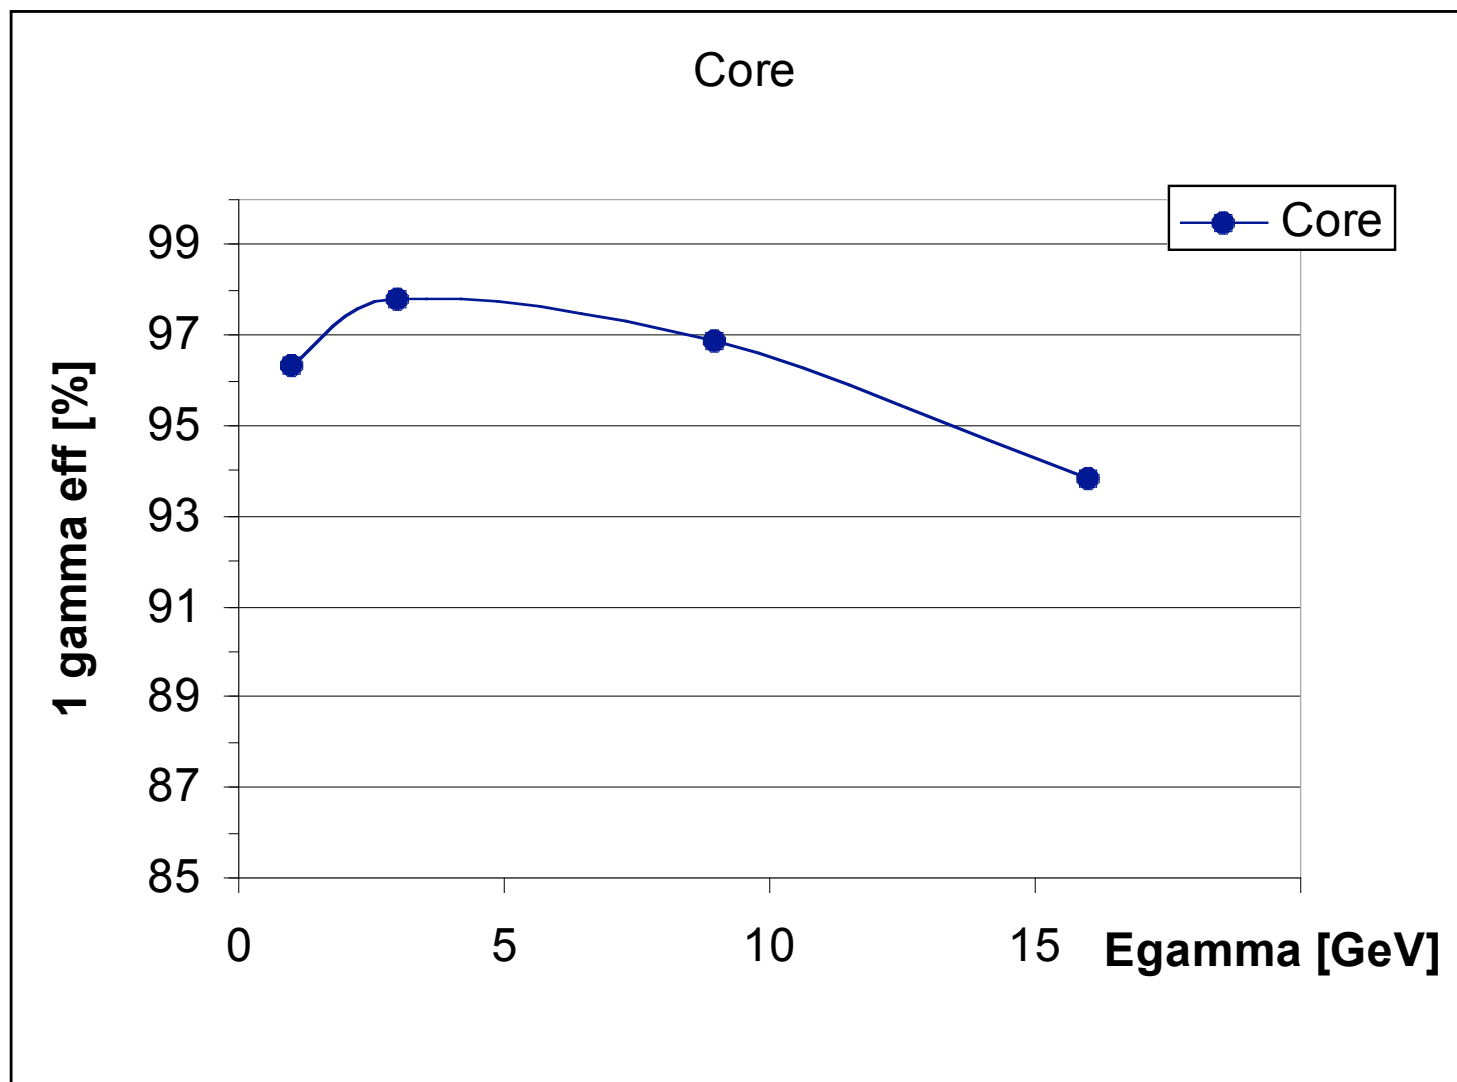

Corner 2

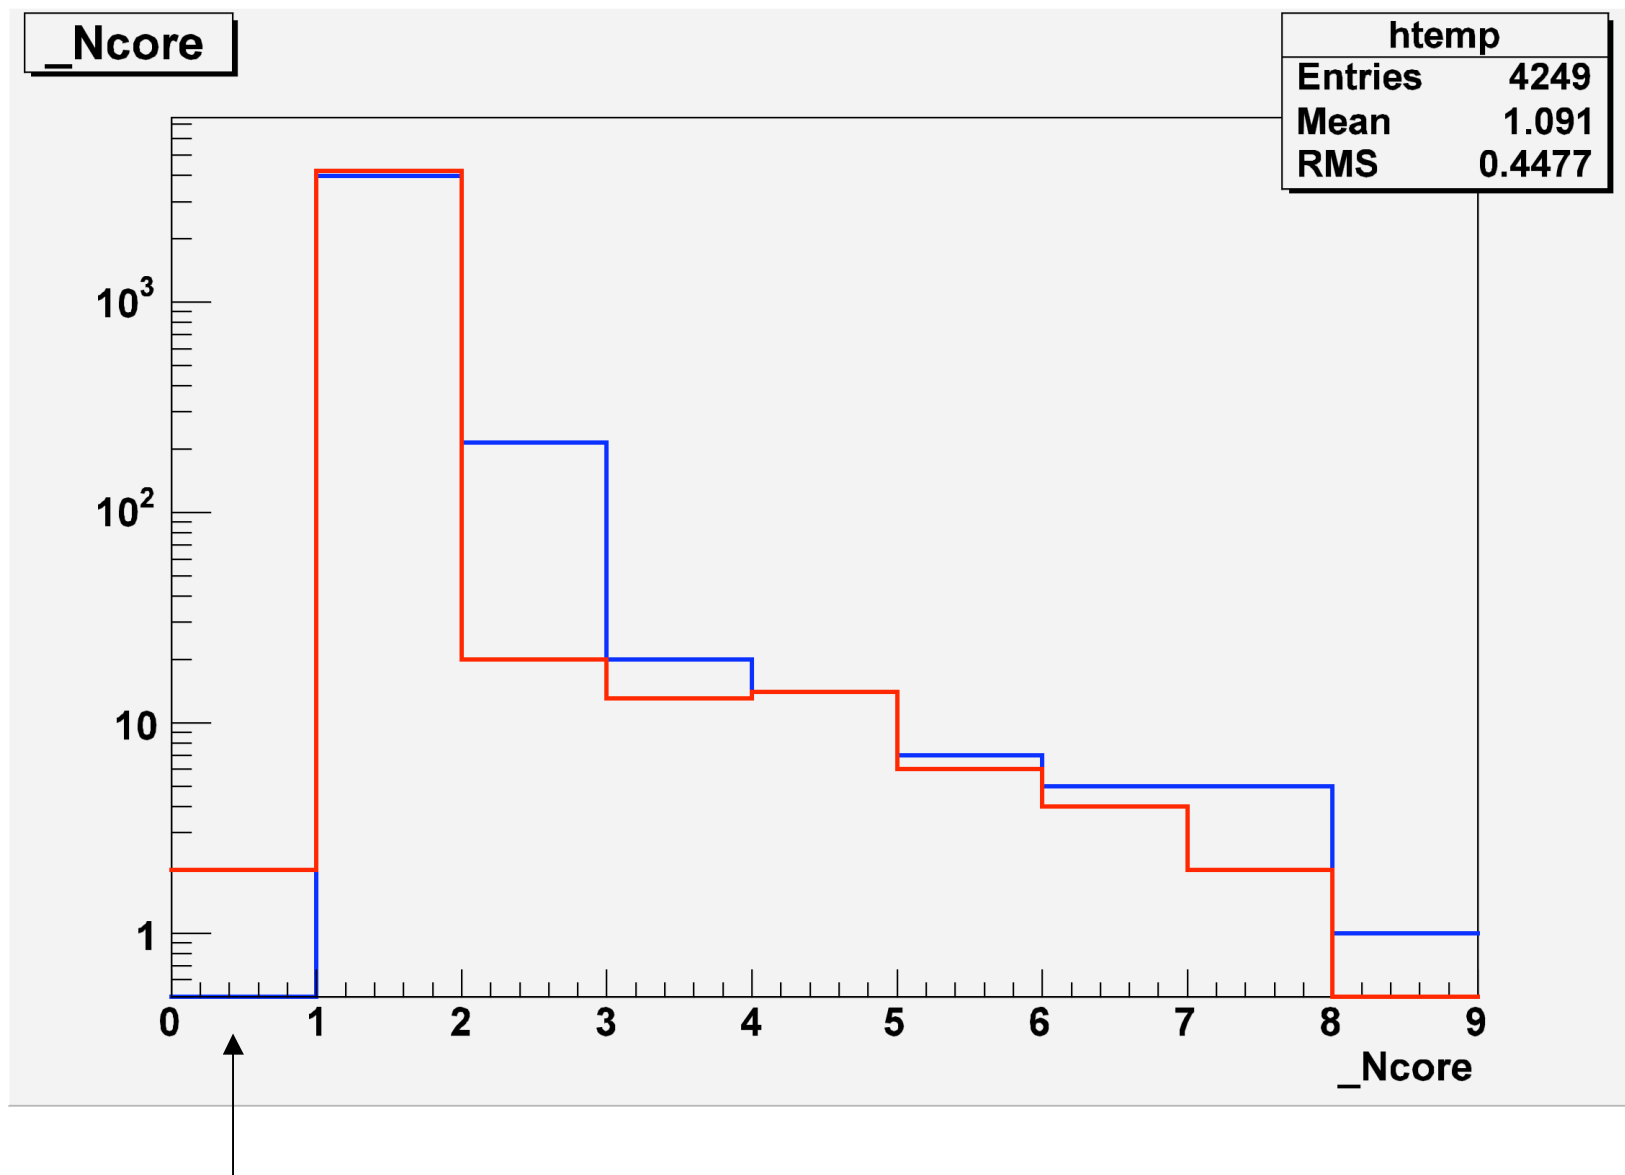

1 to 4

gamma

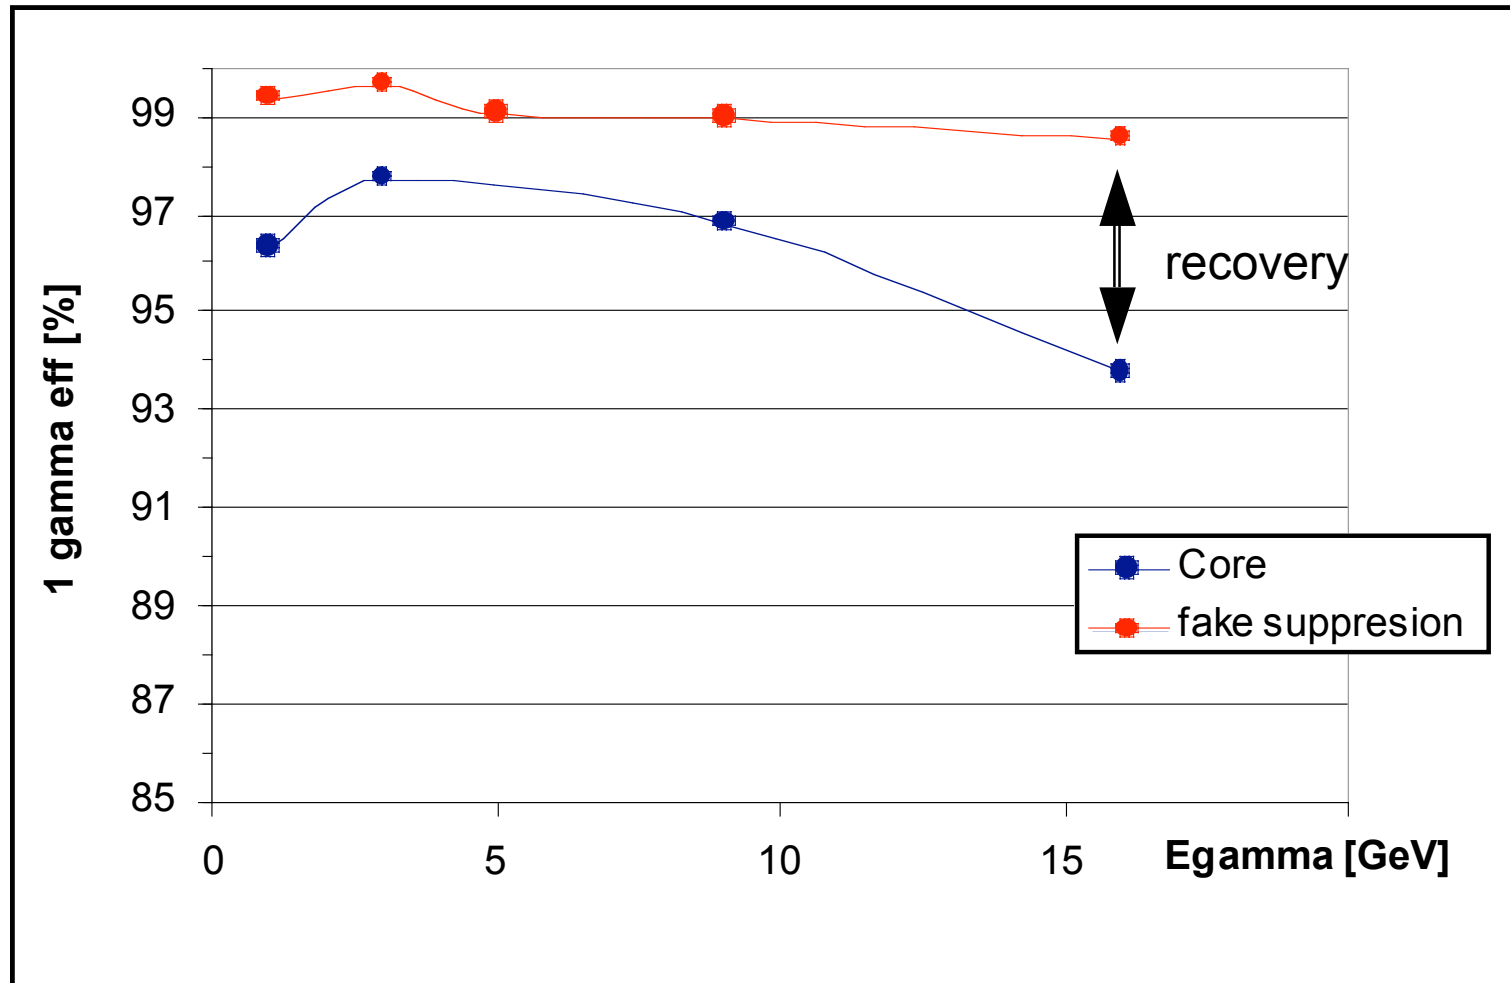

You need a special procedure for corner !!

Efficiency to get 1 back if you “shoot” one in

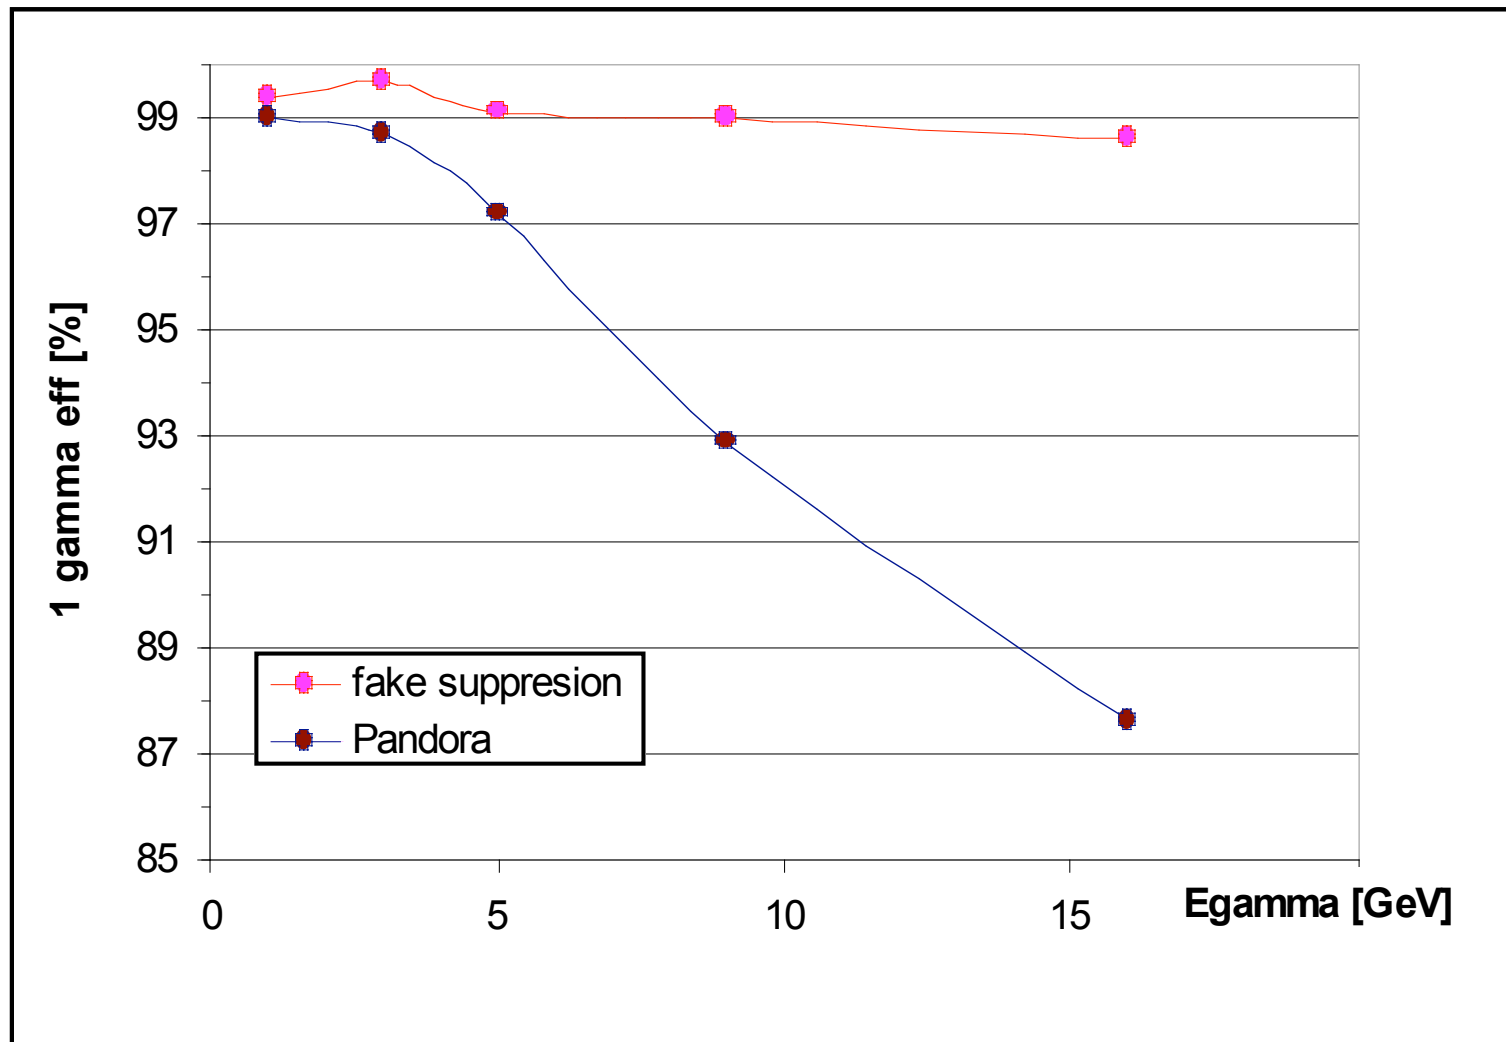

* Problem with calibration function => returned 0 This is a bug not a feature !

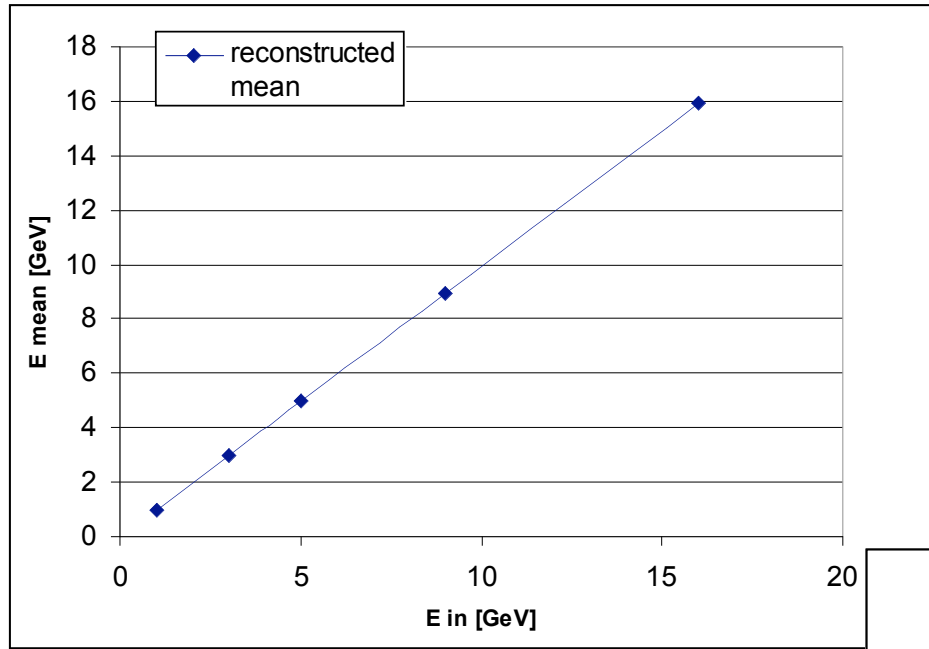

First guess fake suppression recovers most of the fakes

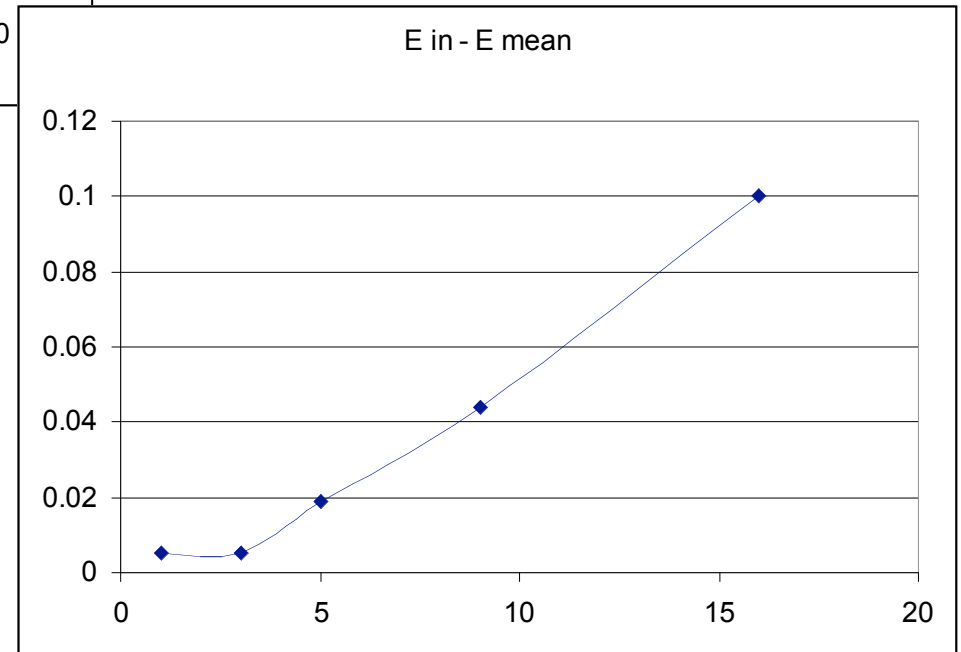

* 5GeV point on the core curve is missing due to the fingers faster then the brain i.e. file was deleted by mistake

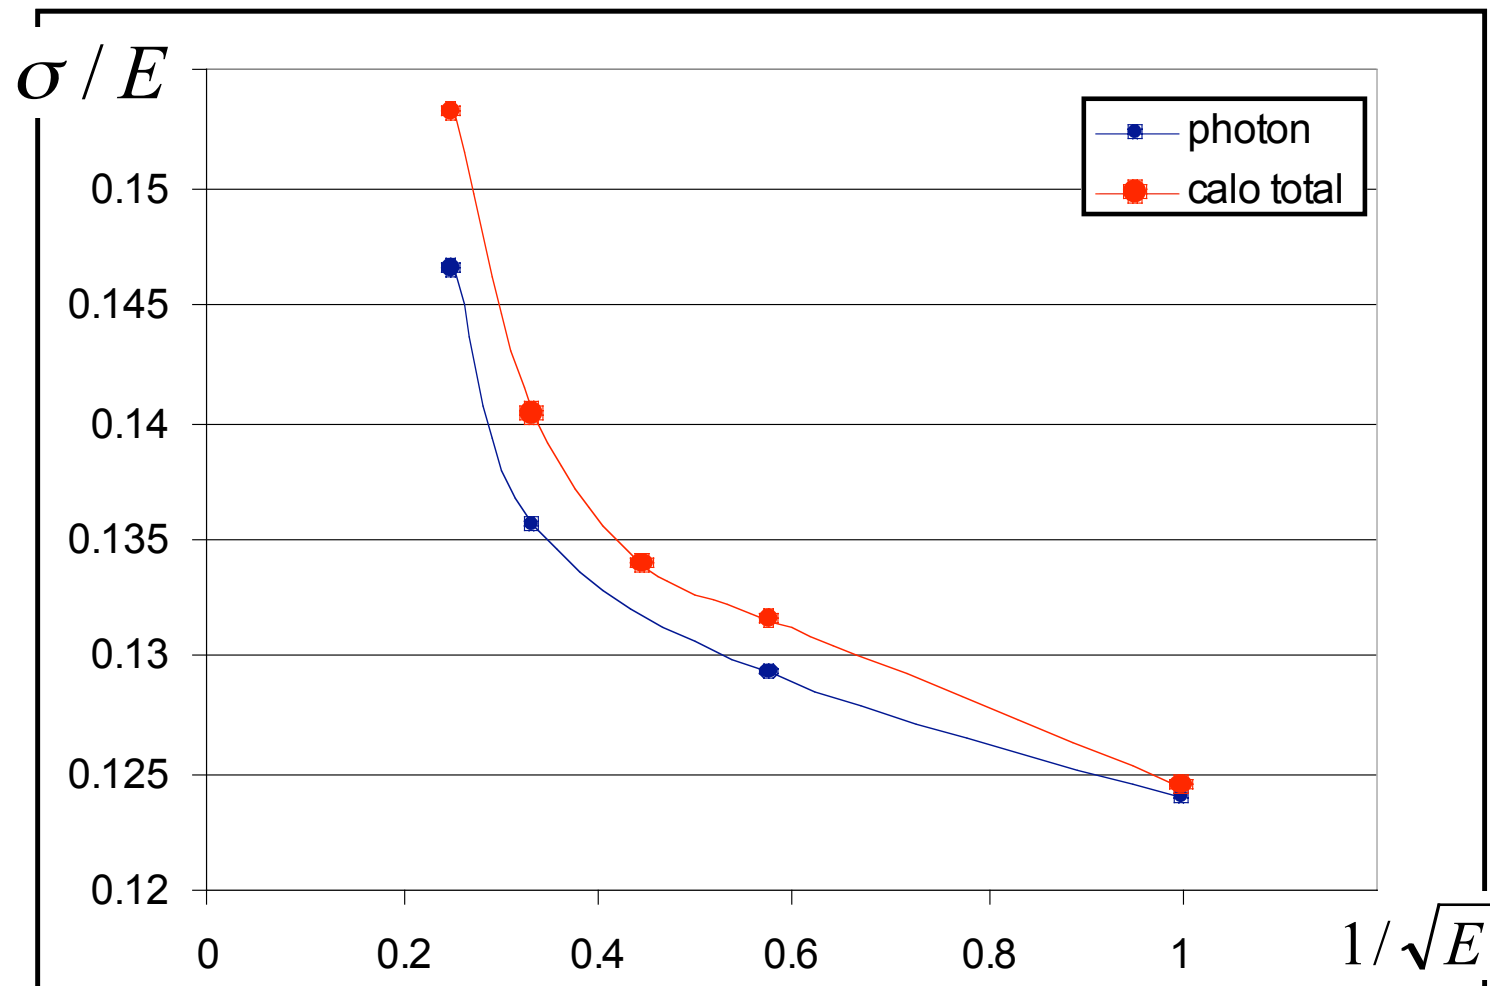

Comparison with Pandora

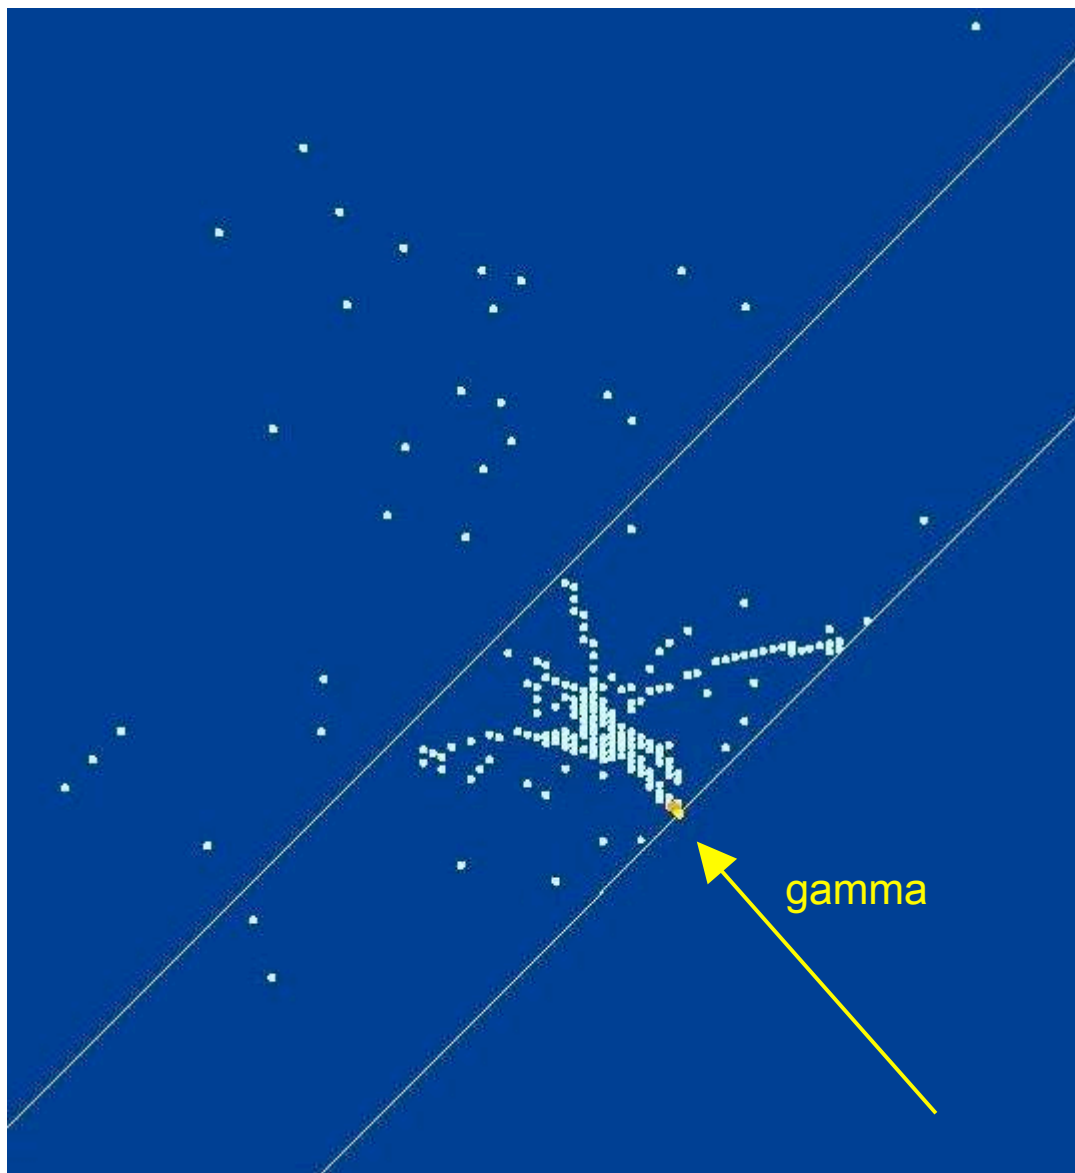

Linearity – good

Yes there is longitudinal leak to the HCAL since this part **was not treated !**

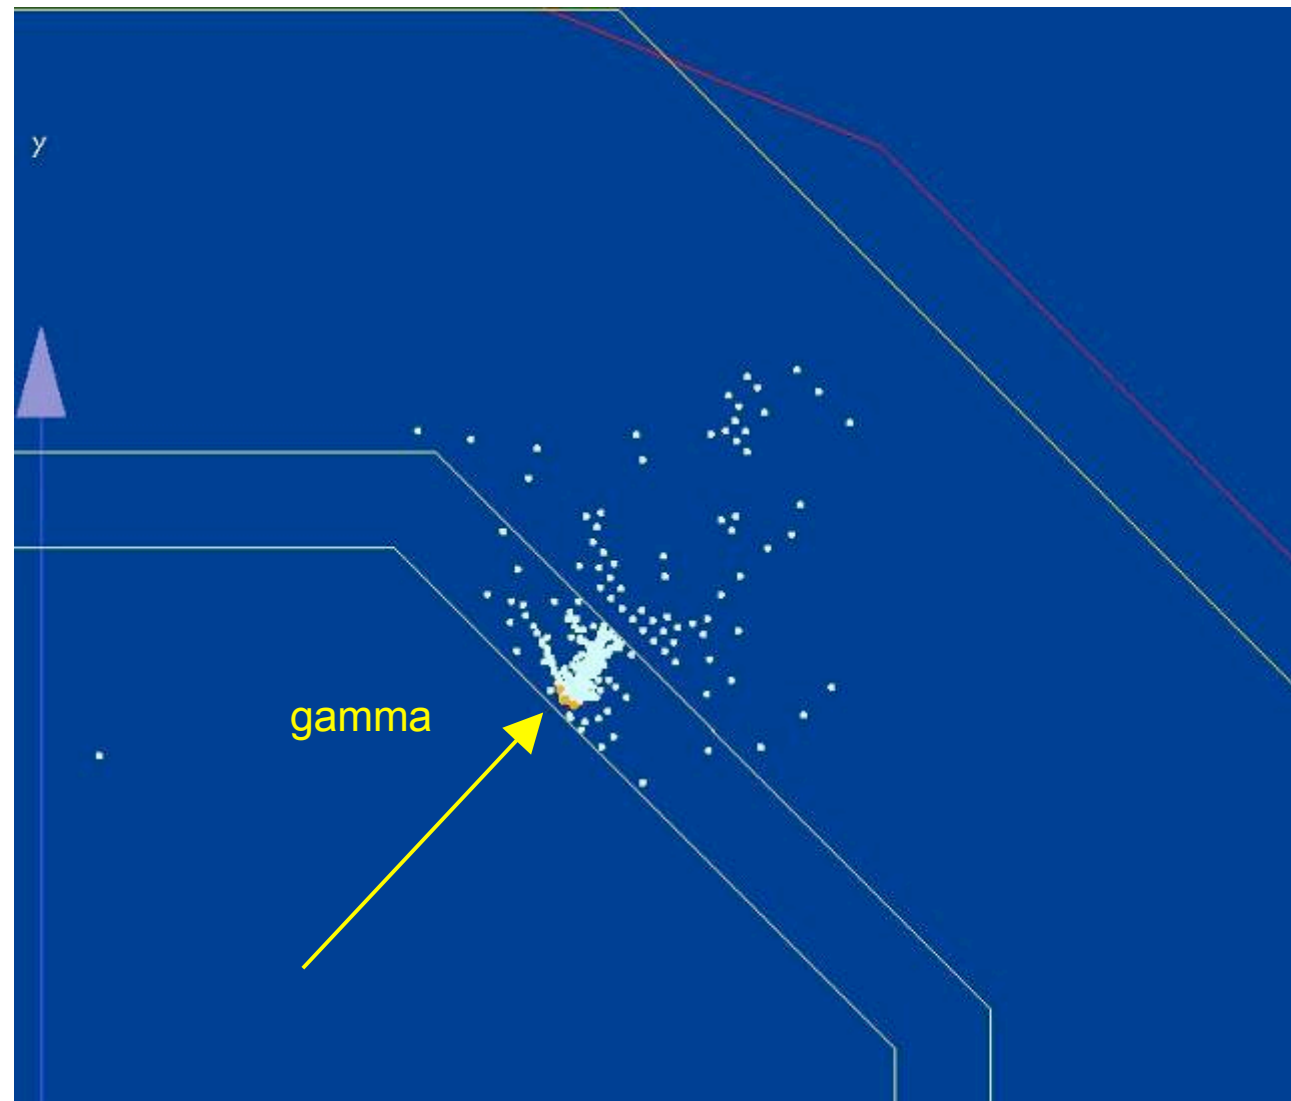

Strange “hadron”
Events

Not seen only in 1GeV
Sample !!!

What is the “physics” that
produces this ???

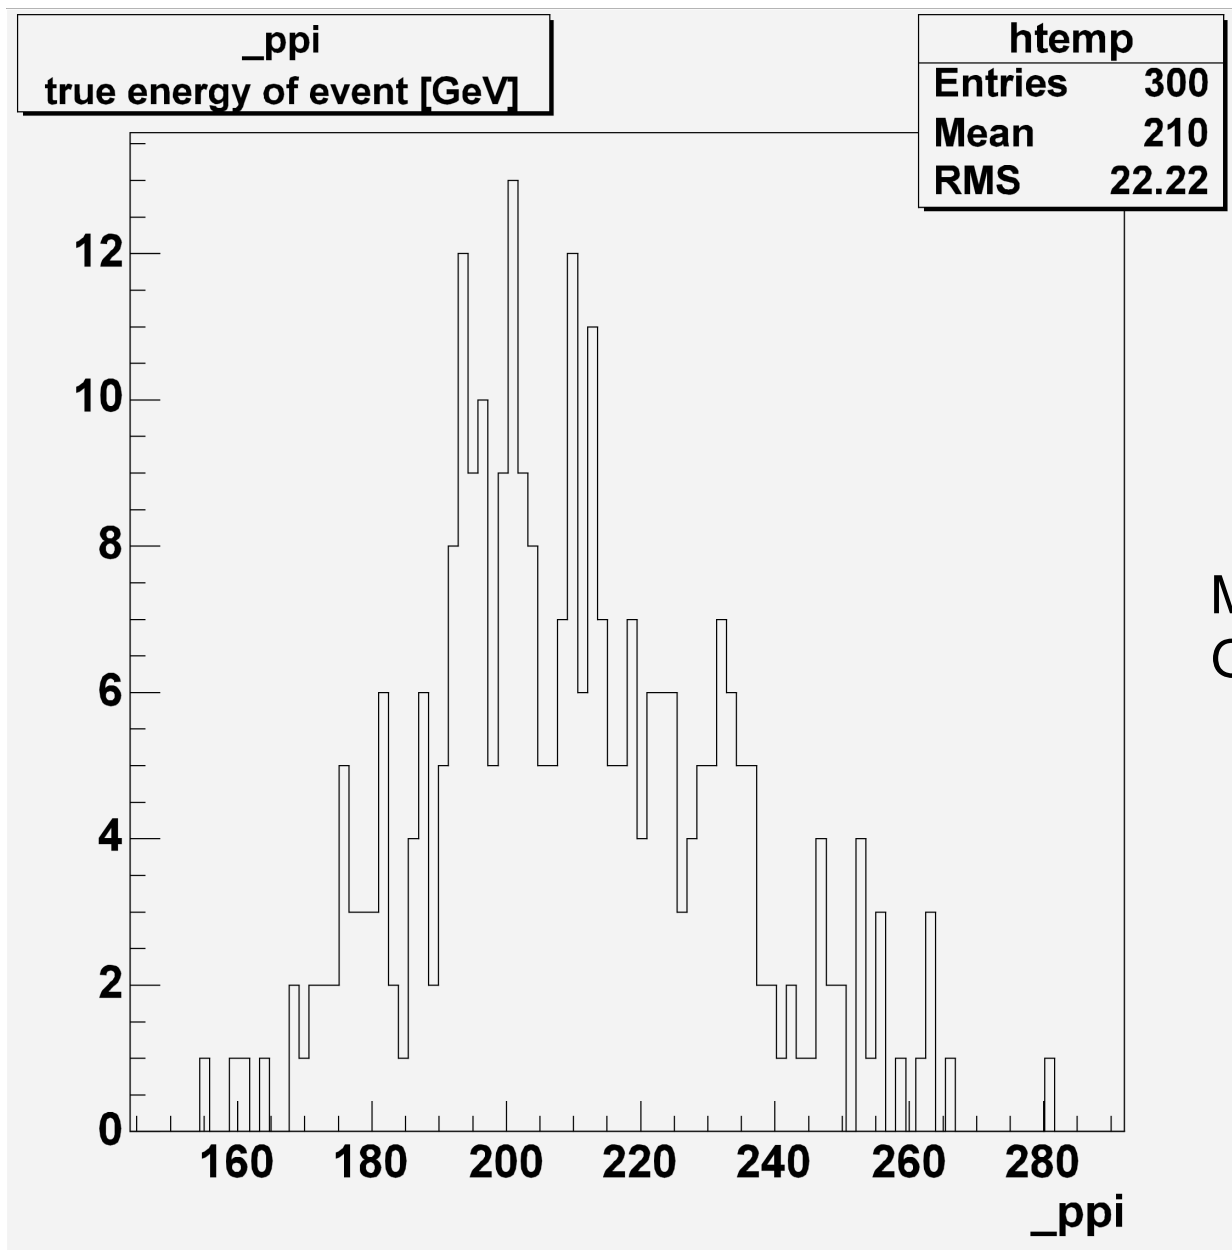

Strange “hadron”
events

CCC

Complains	Congratulation	Conclusion
<ul style="list-style-type: none">• Yes the user still needs to DO something and to UNDERSTAND what is doing on• Final decision on quality check is on users shoulders• Documentation at the moment only in the code i.e. enough for experts more detailed to come	<ul style="list-style-type: none">• It can be incorporated in more complex procedures• It will work with different cell sizes !!! (as long as layer thickness < cell_size out of box)	<ul style="list-style-type: none">• Code is available from cvs with an example processor• It works• you can play with parameters for E range of your interest (not recommended for below 0.5GeV)

Appendix beyond this page

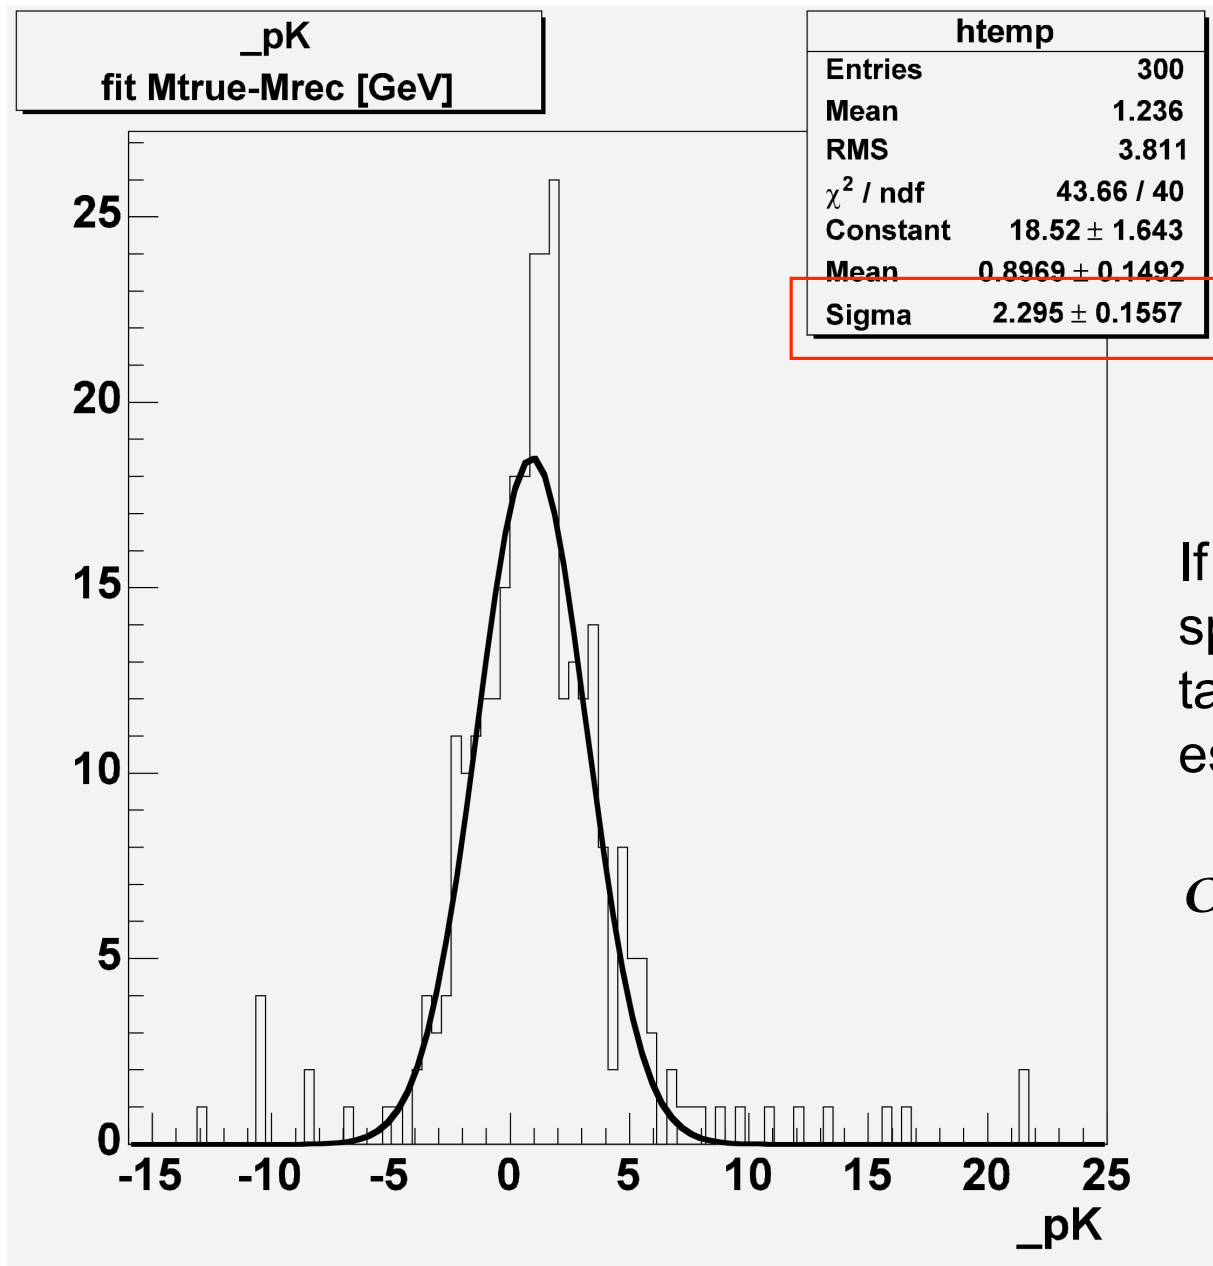

20 photons over the
Detector

Egamma 1-20GeV

Mass distribution of the
Generated events

Tracking and V0 search
Included plus electron
reconstruction

$$\sigma = 2.3 \pm 0.16$$

If one neglects the spread of the events and takes mean as an estimator

$$\begin{aligned}\sigma_{\text{perfect}} &= 0.135\sqrt{210} \\ &= 1.96\end{aligned}$$

Tabular results for considered energies 1 gamma per event is input

1 GeV
