

Determining k_T (cal factor for $P_{trans} \rightarrow E_{acc}$)

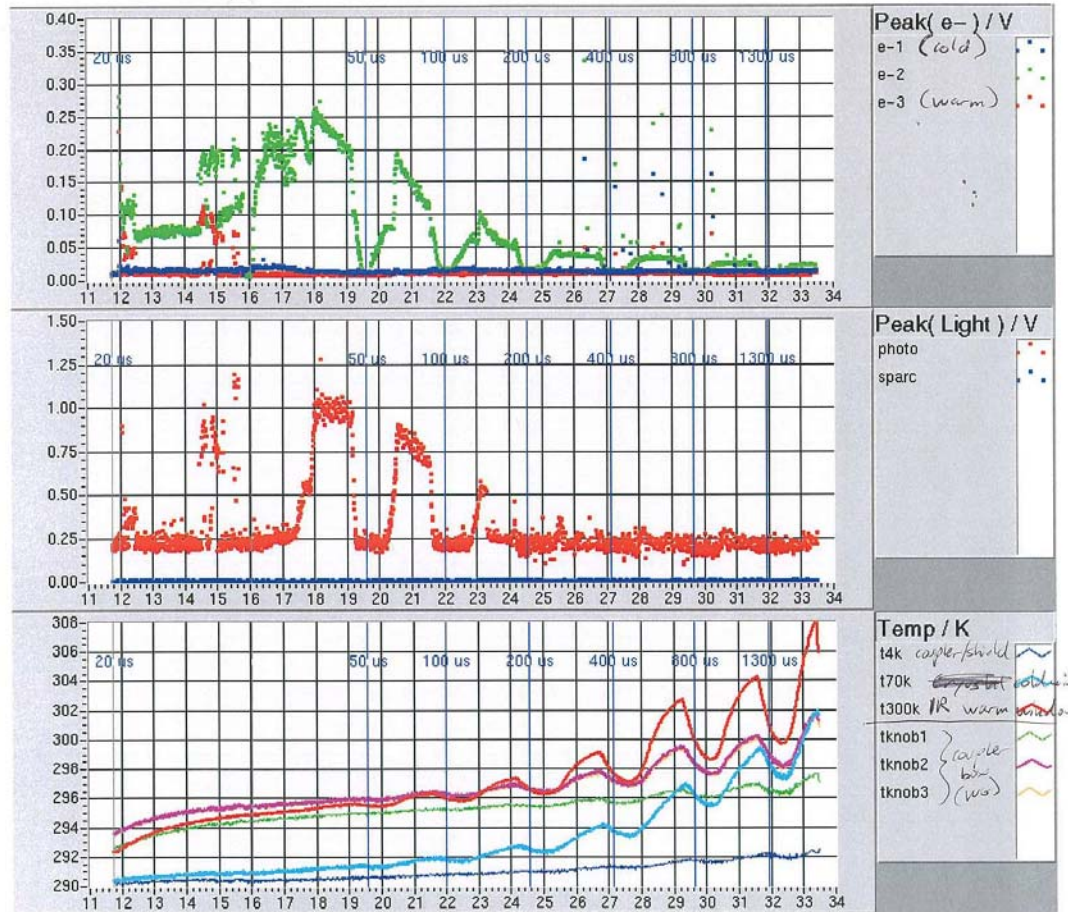

Example of LabVIEW application displaying data from DOOCS Simcon server at CHECHIA (DESY)

Slide found showing (among other things) architecture of interlock DAQ crate --- steal some signals from here

Fast signals

- Electron pickups (x 3) → *steal from IL crate*
- Cavity vacuum, coupler vacuum → *steal from PLC*
- P_{forw} , P_{refl} , P_{trans} → *steal from LLRF system*
 - Amplitude and phase
- P_{HOM} (x 2) → *not yet assigned to a readout channel*
- Faraday cups (dark current) → *not yet assigned to a readout channel*
- Coupler temperatures [RTD (x ?), IR] → *steal from PLC*
- Photodiode → *steal from IL crate*
- PMT → *steal from IL crate*

Example of LabVIEW (DOOCS?)
 logging data over long term at
 CHECHIA (DESY)
