

ILC 9mA P_K/Q_L studies at FLASH

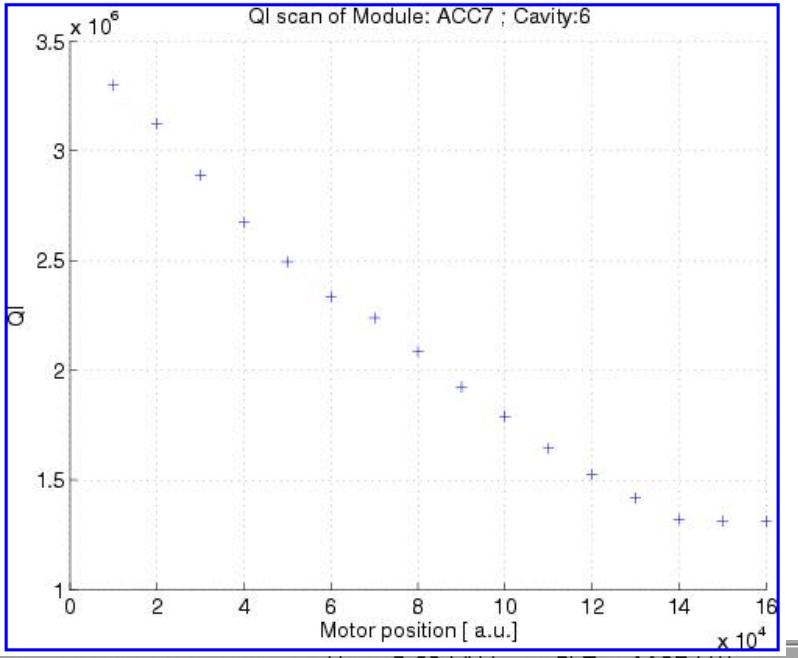

shift summary and time logs

Feb 4-8 2011

5 LLRF shifts : overall view

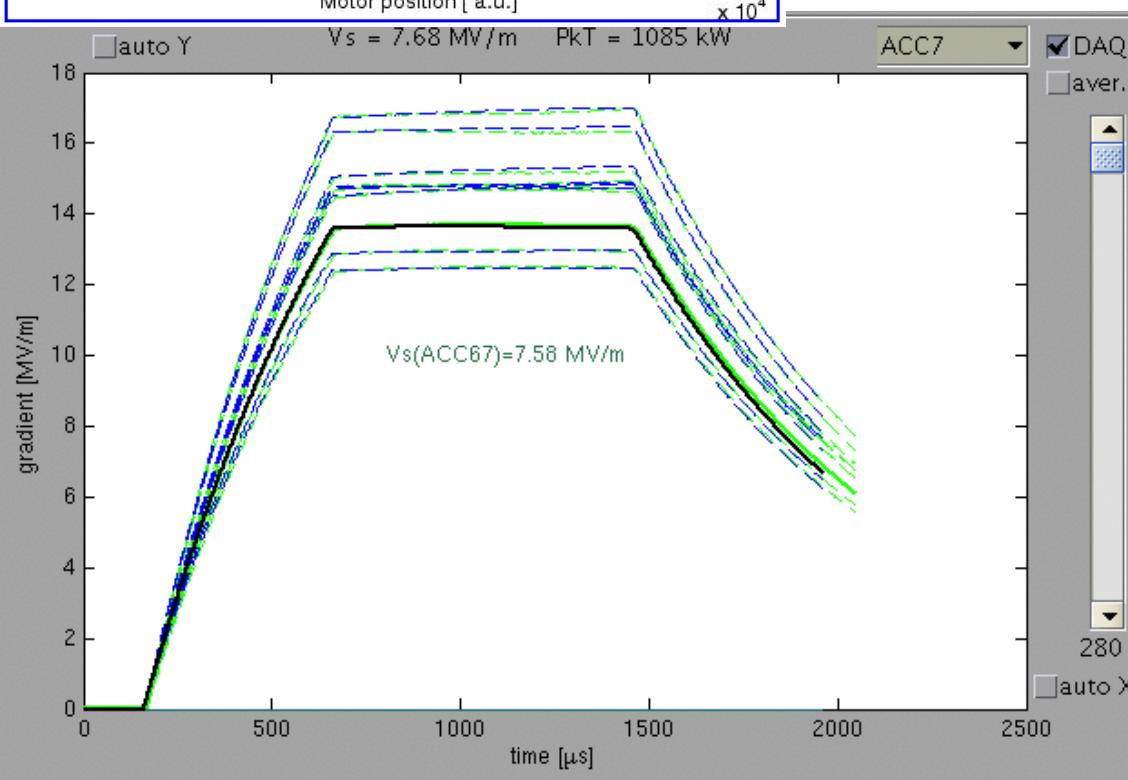

- Friday 2/4 night shift:
 - no beam
 - ACC6/7 vector sum calibration 100 bunches, 1 MHz, 1.6 nC
 - QL tuners characterization for ACC6/7
 - simulator calibration to reflect ACC6/7 power distribution
- Saturday 2/5 night shift:
 - 1mA beam, low gradient (100 MeV – 200 MeV)
 - Successfully implemented QL adjustments to flatten cavity gradients
 - beam loading tilts correction (all tilts below 1%) using simulator predicted values
 - Simulated values are reliable
- Sunday 2/6 night shift:
 - 1.6mA beam, low gradient (200 MeV)
 - low gradient, beam loading tilts Q_L correction (below 1%)
 - beam current scan
 - QL scan
- Monday 2/7 night shift:
 - 3.0mA beam, 200 MeV
 - QL adjusted for gradient flat at 3mA
 - beam scan from 0.9 to 4.5 mA
 - 4.5mA beam, 300 MeV
 - QL adjusted for gradient flat at 4.5 mA
 - beam current scan
- Tuesday 2/8 afternoon shift:
 - 4.2mA beam, 360 MeV
 - Lorentz force detuning compensation
 - Use calculator to predict QL → gives very accurate prediction
 - Flatten ACC6/7 gradients tilts to ~ 1.5%
 - beam current scan

Friday Feb. 4 night shift

Friday 2/4 night shift – highlights:

- no beam
- ACC6/7 vector sum calibration 100 bunches, 1 MHz, 1.6 nC
- Q_L tuners characterization for ACC6/7
- simulator calibration to reflect ACC6/7 power distribution

Tuesday Feb. 8 afternoon shift

Tuesday 2/8 afternoon shift – highlights:

- 4.2mA beam, 360 MeV
- Lorentz force detuning compensation
- Use calculator to predict Q_L → very accurate prediction
- Flatten ACC6/7 gradients tilts to ~ 1.5% (tuned for 4.2mA)
- beam current scan to 4.5 mA

 - 0.6nC 21:00:07
 - 0nC 21:07:04
- Tilt measurement 21:26
- Readjustment of piezo

A few comments

- Overall, machine very reliable and up all the time
 - Some hysteresis with frequency tuner
 - No end cap for Q_L tuners
- Tuning the cavity plays a crucial role in getting the gradient flat
 - Static detuning
 - LFD compensation
- Easier to flatten cavities:
 - at lower gradients (less LFD)
 - at lower currents (less beam loading, smaller Q_L corrections)
- Simulation is reliable to predict Q_L values
- No solution to flatten cavity traces for maximum gradient
