## Higgs recoil mass study using

## ZH -> qqH channel @ 250 GeV ILC

Tatsuhiko Tomita (Kyushu Univ.)
Akiya Miyamoto (KEK), Taikan Suehara (Kyushu Univ.)

## Reminder : Why qqH channel?

In recoil mass study, leptonic channel such as Z -> e+e-, mu ${ }^{+}$mu- has very good signal/background ratio.

Since four momentum conservation of electron-positron collider, We should not assume any higgs decay mode. ${ }^{50}$
-> Model independent.
But, the branching ratio of Z -> leptonic
 is $\sim 3.5 \%$ for each generation.

On the other hand, the branching ratio of
Z -> hadronic is $\sim 70 \%$.

## Reminder : Background estimation

We did forced 4-jet clustering to cut the background of ZZ/WW. (using DBD samples)
And we decided the cut box as $(81,101)$ for ZZ, $(70,90)$ for WW.

After cut, ZZ reduced 50\% and WW reduced 60\%.
Then, we did y -value clustering to do recoil mass study.

$$
y=\frac{2 \min \left(E_{i}^{2}, E_{j}^{2}\right)\left(1-\cos \theta_{i j}\right)}{Q^{2}}=0.005
$$

## Reminder : The result so far

As another cut step, we used these variables.

> Ejet $>10 \mathrm{GeV}$ (to reduce small jets) jetPt $>20 \mathrm{GeV}$ (to reduce back to back Z)
> $76 \mathrm{GeV}<$ dijetmass(y-fix) $<106 \mathrm{GeV}$ recoil mass $>110 \mathrm{GeV}$

Applied all cut, we got...

| qqH <br> $(22,669)$ | ZZ/WW <br> $(266,091)$ |
| :---: | :---: |
| significance | $42.2 \sigma$ |

hadronic background only

Efficiency is not consistent with each mode... $\mathrm{bb} / \mathrm{gg} / \mathrm{cc}$ is strange!

## Efficiency investigation

The comparison of 4-jet clustering these three modes (bb/cc/gg)

Slightly long tail to lower side is observed only in bb mode. It might be caused neutrino emission from b-quark decay process?

We looked the plot of the result from visible energy.

## Visible energy

## visible energy (scaled)

bb mode has a larger missing energy than the other two mode.
We should set visible energy cut for 4 jet clustering...

## 4 jet mass (visible $>220$ or $<=220$ )

## Categories

Now we plan to categorize higgs decay mode using

- the number of jets (2, 3, 4, and more than 5)
- the number of Iso lepton ( 0,1 , and more than 2 )
- visible energy (more/less than 220 or 230)

Try to find optimal cut to reduce efficiency disagreement for each category.
applying optimal cut for each category.
Combine the result of each category.

We can make final decision of optimal cut.

## Remain issues - 2

| $\%$ | $6.4 \%$ | $7.7 \%$ | $2.4 \%$ | $21.6 \%$ | $17.2 \%$ |

for ZZ, this cut is very useful !
for WW, this cut is not so much useful !
Here we should do tau tagging to decide more optimal cut for WW semi leptonic decay.

## Summary and Prospects

- We tried investigation about disagreement of efficiency.
-> Since b-quark emits neutrino in their decay process, there is missing energy. => visible energy cut (good)
-> Tau problem => should do tau tagging.
-> Recoil mass cut has also disagreement, should be investigate.
-> categorize the decay and optimize the cut for each category.
- 2-jet clustering is promising to reduce semi-leptonic background...
-> for ZZ , it is OK.
-> for WW, it is not powerful enough. first we try tau tagging !
