- Numerical Analysis
- Gauge Coupling Unification
- Conclusions

A. μ/B_{μ} Problem and EW Symmetry Breaking

In the MSSM, we need a term

$$\Delta \mathcal{L} = \int d^2 \theta \mu \mathbf{H_d} \mathbf{H_u} + h.c.$$

to give the Higgsinos a mass.

• To stabilize the EW scale, μ and B_{μ} parameters need to satisfy the minimization conditions of the Higgs potential

$$\mu^{2} = -\frac{M_{Z}^{2}}{2} + \frac{m_{H_{d}}^{2} - m_{H_{u}}^{2} \tan^{2} \beta}{\tan^{2} \beta - 1}, \quad \tan \beta = \frac{v_{u}}{v_{d}}$$

$$B_{\mu} = (m_{H_{d}}^{2} + m_{H_{u}}^{2}) \frac{\sin 2\beta}{2}$$

• μ/B_{μ} problem: is there a dynamical way to induce the EW scale values for μ and B_{μ} ? Particularly in GMSB.

B. Giudice-Masiero Mechanism

- ullet Assume exact PQ symmetry to forbid the bare μ term.
- Introduce higher dimensional operators in Kahler potential

$$\Delta \mathcal{L} = \int d^4 heta \mathbf{H_d} \mathbf{H_d} \Big(rac{c_1}{M} \mathbf{X}^\dagger + rac{c_2}{M^2} \mathbf{X}^\dagger \mathbf{X} \Big) + h.c.$$

with $\mathbf{X} = X + \theta^2 F_X$ being a SUSY breaking spurion. Then

$$\mu = \frac{c_1 \langle F_X \rangle}{M}, \quad B_\mu = \frac{c_2 \langle F_X \rangle^2}{M^2}.$$

 Typically, c₁ and c₂ are generated at the same loop level in GMSB, implying

$$B_{\mu}/\mu \sim \langle F_X \rangle/\Lambda_M \sim 100 \text{TeV}.$$

 Different alternatives have been proposed, e.g., effectively generating c₁ and c₂ at different loop levels. But, new dimensional parameters are introduced (G. Giudice et.al.'96,'07)

C. Light Singlet Mechanism

- Assume exact global symmetries (NMSSM, nMSSM) or gauge symmetry (UMSSM) to forbid μ term in MSSM
- Introduce a singlet chiral superfield N in the observable sector which has the coupling

$$\Delta \mathcal{L} = \int d^2 \theta \lambda \mathbf{N} \mathbf{H_d} \mathbf{H_u} + h.c.$$

• The effective μ and B_{μ} parameters arise as

$$\mu = \lambda v_N, \qquad B_\mu = \lambda \langle F_N \rangle + A_\lambda \mu.$$

 As long as N and F_N are stabilized at the EW scale, we will have the correct relationship

$$rac{B_{\mu}}{\mu} \sim rac{\langle F_N
angle}{v_N} \sim 10^2 - 10^3 {
m GeV}.$$

- Main difficulties: (1) how to generate a negative enough m_N²(Λ_{EW}) term in the Higgs potential, to stabilize N to Λ_{EW};
 (2) how to avoid the light U(1)_R axion problem? (M. Dine et. al. '93)
- In the minimal GMSB

$$W = \lambda \mathbf{Sqq} + \gamma \mathbf{S\bar{I}I}$$

where $(q+I, \bar{q}+\bar{I})=(3+2,\bar{3}+\bar{2})$ are vector-like messengers, and $\mathbf{S}=S+\theta^2F_S$ is the SUSY breaking spurion, one never gets a negative enough $m_N^2(\Lambda_{EW})$ term, independently of the messenger scale (M. Dine '93; H. Murayama et. al. '99)

There are several kinds of modifications (in the mGMSB framework), but the results are not satisfactory: (M. Dine et. al. '93; G. Giudice et. al. '97,'07; T. Han et.al. '99; P. Langacker et. al. '99)

A. The Structure of "General Gauge Mediation"

Consider a gauge mediation structure

$$W = \zeta \mathbf{S}_q \bar{\mathbf{q}} \mathbf{q} + \gamma \mathbf{S}_l \bar{\mathbf{I}} \mathbf{I},$$

with S_q and S_l being SUSY breaking spurions.

Then we have TWO effective SUSY breaking scales

$$\Lambda_q = \frac{\langle F_q \rangle}{\langle S_q \rangle}, \qquad \Lambda_l = \frac{\langle F_l \rangle}{\langle S_l \rangle}.$$

 This extra freedom degree can help implement the light singlet mechanism.

B. How General is the "General Gauge Mediation"?

- Such a gauge-mediation structure can naturally arise in many backgrounds.
- For example, assume more than one SUSY breaking spurion in the hidden sector while keeping the messenger sector minimal, then (M. Dine et. al. '07)

$$W = \lambda_i \mathbf{S}_i \bar{\mathbf{q}} \mathbf{q} + \gamma_i \mathbf{S}_i \bar{\mathbf{I}} \mathbf{I},$$

By redefining

$$\mathbf{S}_q = \lambda_i \mathbf{S}_i, \quad \mathbf{S}_l = \gamma_i \mathbf{S}_i.$$

we have

$$W = S_a \bar{q}q + S_l \bar{l}l,$$

which is exactly the structure we are considering.

C. Generating Large Negative $m_N^2(\Lambda_{EW})$

The NMSSM has a superpotential for the Higgs superfields

$$\mathbf{W} = \lambda \mathbf{N} \mathbf{H}_{\mathbf{d}} \mathbf{H}_{\mathbf{u}} - \frac{1}{3} \kappa \mathbf{N}^{3},$$

• The leading order soft masses at the messenger scale Λ_M are:

$$M_3 = \frac{\alpha_3}{4\pi}\Lambda_q$$
 $M_2 = \frac{\alpha_2}{4\pi}\Lambda_l$ $M_1 = \frac{\alpha_1}{4\pi}\left[\frac{2}{5}\Lambda_q + \frac{3}{5}\Lambda_l\right]$

$$m_{\phi}^{2} = 2 \left[C_{3}^{\phi} \left(\frac{\alpha_{3}}{4\pi} \right)^{2} \Lambda_{q}^{2} + C_{2}^{\phi} \left(\frac{\alpha_{2}}{4\pi} \right)^{2} \Lambda_{l}^{2} + C_{1}^{\phi} \left(\frac{\alpha_{1}}{4\pi} \right)^{2} \left(\frac{2}{5} \Lambda_{q}^{2} + \frac{3}{5} \Lambda_{l}^{2} \right) \right]$$

 C_i^{ϕ} s are quadratic Casimir operators of the scalar ϕ .

• RGEs (1-loop) of $m_{H_U}^2$ and m_N^2 ($\Lambda_M \to \Lambda_{EW}$):

$$16\pi^{2} \frac{d}{dt} m_{H_{u}}^{2} = 6h_{t}^{2} (m_{\tilde{Q}_{3}}^{2} + m_{H_{u}}^{2} + m_{\tilde{t}}^{2} + A_{t}^{2}) + 2\lambda^{2} (m_{H_{d}}^{2} + m_{H_{u}}^{2} + m_{H_{u}}^{2} + M_{L}^{2}) + 8(\frac{1}{4}g_{Y}^{2}M_{1}^{2} + \frac{3}{4}g_{2}^{2}M_{2}^{2}),$$

$$16\pi^{2} \frac{d}{dt} m_{N}^{2} = 4\lambda^{2} (m_{H_{d}}^{2} + m_{H_{u}}^{2} + m_{N}^{2} + A_{\lambda}^{2}) + 4k^{2} (3m_{N}^{2} + A_{k}^{2}).$$

- In the minimal GMSB ($\Lambda_I = \Lambda_q$), $m_{H_u}^2$ gets negative quickly due to the top (s)quark contributions, but m_N^2 not. \Rightarrow too small $|m_N^2(\Lambda_{EW})|$.
- In the general GMSB, if Λ_I > Λ_q, the evolution of m²_N to a negative value is accelerated, and that of m²_{H_u} is slowed down. ⇒ large negative m²_N(Λ_{FW})

D. No Light $U(1)_R$ Axion Problem

• The RGE of $m_{H_d}^2$ is given by

$$\frac{d}{dt}m_{H_d}^2 = \frac{2\lambda^2}{16\pi^2}(m_{H_d}^2 + m_{H_u}^2 + m_N^2 + A_\lambda^2) - \frac{2}{16\pi^2}(g_Y^2M_1^2 + 3g_2^2M_2^2)$$

Relatively large $\Lambda_I \Rightarrow$ relatively large positive $m_{H_d}^2(\Lambda_{EW})$

• The eigenvector of the light Higgs pseudoscalar is $(v_N \gg v)$:

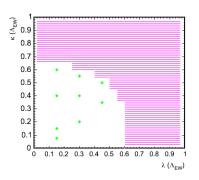

$$\begin{array}{rcl} a_1 & = & \cos\theta_A\,A_{MSSM} + \sin\theta_A\,A_N, \\ \tan\theta_A & = & \frac{v_N}{v\sin2\beta}, \\ \sin2\beta & = & \frac{2B_\mu}{m_{H_d}^2(\Lambda_{EW}) + m_{H_u}^2(\Lambda_{EW}) + 2\mu^2} \end{array}$$

• Large $m_{H_d}^2(\Lambda_{EW}) \Rightarrow$ small $\sin 2\beta$ or large $\tan \beta \Rightarrow \theta_A \approx \pi/2$. So the light Higgs pseudoscalar is singlet-like.

IV. Numerical Analysis

A. The Strategy

- Low- ($\sim 10^5$ GeV), intermediate- ($\sim 10^{11}$ GeV) and high-scale ($\sim 10^{15}$ GeV) gauge mediations are considered.
- For each case, nine characteristic points are studied, all of them specified by $\lambda(\Lambda_{EW})$ and $\kappa(\Lambda_{EW})$ and located in the perturbative region.

IV. Numerical Analysis

B. Some General Comments

- Four unkown input parameters: $\lambda(\Lambda_{EW})$, $\kappa(\Lambda_{EW})$, the messenger scale Λ_M and $\eta = \Lambda_I/\Lambda_q$
- For all of the 9 \times 3 characteristic points, physical results are obtained by giving proper values to η : 2 6
- A relatively large tan β : 5 \sim 50 is favored.
- The composition of singlet in the light U(1)_R axion is larger than 1 – 10⁻⁴
- For large $\tan \beta$ and $v_N \gg v$, $m_{h_1}^2 < M_Z^2$ at the tree-level \Rightarrow heavy stops $\sim \mathcal{O}(\text{TeV}) \Rightarrow$ fine tuning of $\mathcal{O}(10^{-3})$ in the low-scale scenario and $\mathcal{O}(10^{-2})$ in the other two scenarios.
- These physical features could be extended into the non-perturbative $\kappa \lambda$ region as long as these couplings stay perturbative at the messenger scale.

V. Gauge Coupling Unification

• In the MSSM, the SU(5) GUT predicts $\alpha_3(M_z) = 0.125$ at one-loop level, compared to the experimental value ~ 0.120 . The threshold correction is given by

$$\Delta \alpha_3(M_Z)_{MSSM} \simeq -\frac{19}{28\pi} \alpha_3(M_Z)^2 \ln \left(\frac{|\mu|}{M_Z} \left(\frac{M_2}{M_3}\right)^{3/2}\right)$$

For $\mu \sim \mathcal{O}(10^2 \text{GeV})$, this correction is not negative enough. (P. Langacker et.al.'93, C. Wagner et.al.'93)

• In our model,

$$\Delta \alpha_3(M_Z) \simeq \alpha_3(M_Z)^2 \left(\frac{9}{14\pi} \ln \left(\frac{\langle S_q \rangle}{\langle S_l \rangle} \right) - \frac{19}{28\pi} \ln \left(\frac{|\mu|}{M_Z} \left(\frac{\eta \alpha_2}{\alpha_3} \right)^{3/2} \right) \right)$$

V. Gauge Coupling Unification

• If $\langle F_l \rangle/\langle F_q \rangle \simeq \eta$, then $\langle \mathcal{S}_q \rangle/\langle \mathcal{S}_l \rangle \sim$ 1 and

$$\Delta_{\eta}\alpha_3(M_Z) = \Delta\alpha_3(M_Z) - \Delta\alpha_3(M_Z)_{MSSM} \simeq -\frac{57}{56\pi} \alpha_3^2(M_Z) \ln \eta.$$

• If $\langle F_q \rangle \sim \langle F_l \rangle$, then $\langle \mathcal{S}_q \rangle / \langle \mathcal{S}_l \rangle \simeq \eta$ and

$$\Delta_{\eta} \alpha_3(M_Z) \simeq -rac{21}{56\pi} \; lpha_3^2(M_Z) \; \ln \eta.$$

• In both cases, $\Delta_{\eta}\alpha_3(M_Z)\sim \mathcal{O}(0.001)<$ 0, leading to a somewhat better unification prediction than the MSSM limit.

VI. Conclusions

- The light singlet mechanism to solve the μ/B_{μ} problem in GMSB can be well-implementd in the general gauge-mediation (minimal messenger sector + general hidden sector).
- Good features:
 - Large parameter space are allowed: most perturbative $\kappa \lambda$ region + all possible messenger scales
 - Better SU(5) GUT prediction for $\mu \sim \mathcal{O}(100 \text{GeV})$ which is typical in the general gauge-mediation.
 - Universal structure: no difficulty to extend to other contexts, e.g., nMSSM and UMSSM
- Open question: the little hierarchy of particle spectrum, typical in the mGMSB, is preserved \Rightarrow fine-tuning level 10^{-3} in the low-scale scenario and 10^{-2} in the other two scenarios. Can we resolve or release it?

Thank you!

C6	0.951, 0.233	1.58×10^{5}	13.47	492.5	6.20×10^{5}	
C7	0.949, 0.342	1.47×10^{5}	19.86	306.8	3.38×10^{5}	
C8	0.967, 0.087	4.49×10^{5}	4.99	3406.1	1.35 × 10 ⁷	
C9	0.958, 0.123	1.54 × 10 ⁵	7.09	891.2	1.39 × 10 ⁶	

Table: Mass spectrum of particles and superparticles in the high-scale general gauge mediation.

	Particle Masses (TeV)				
Pts	m _g	$m_{\tilde{t}_{1,2}}$	$m_{\tilde{b}_{1,2}}$	$m_{\tilde{\tau}_{1,2}}$	
C1	1.80	1.17, 4.37	3.33, 4.37	1.18, 3.68	
C2	1.27	0.61, 3.07	2.15, 3.06	0.68, 2.67	
C3	1.63	0.68, 3.82	2.08, 3.81	0.89, 3.43	
C4	2.84	1.54, 6.61	3.14, 6.61	2.08, 5.95	
C5	2.29	1.48, 5.62	4.37, 5.61	1.59, 4.71	
C6	1.46	0.52, 3.65	2.64, 3.65	1.00, 3.19	
C7	1.36	0.31, 3.41	2.36, 3.40	0.84, 3.02	
C8	3.90	2.07, 9.98	7.71, 9.98	2.89, 8.48	
C9	1.43	0.71, 3.76	2.64, 3.76	1.14, 3.40	

	Particle Masses (GeV)				
Pts	$m_{\chi_1^c}$	$m_{\chi_1^0}$	m _{h1,2,3}	m _{a1,2}	
C1	791.3	768.6	120.7, 777.4, 3665.7	194.8, 3665.7	
C2	284.6	280.6	122.2, 559.6, 2443.0	139.6, 2442.9	
C3	122.1	119.9	126.8, 639.4, 2207.5	155.3, 2207.4	
C4	112.7	111.6	134.2, 878.8, 2792.8	211.2, 2792.7	
C5	1522.3	1101.0	116.6, 1972.0, 4872.1	698.9, 4871.9	
C6	491.3	486.7	121.2, 1274.9, 3068.7	446.3, 3068.4	
C7	306.0	303.1	120.4, 1086.4, 2765.9	376.0, 2765.6	
C8	3404.4	1981.1	120.1, 5084.2, 8909.4	2193.7, 8909.2	
C9	889.0	771.4	117.2, 1884.6, 3306.1	806.7, 3305.3	

Table: Composition of the light Higgs bosons (\leq 115GeV).

Composition of Light Higgs Bosons (LHB)				
Pts	LHBs	$Im(H_d)$	$Im(H_U)$	Im(N)
A1	a ₁	-1.2×10^{-3}	-8.8×10^{-4}	0.999999
A2	a ₁	-2.0×10^{-3}	-1.1×10^{-5}	0.999998
A3	a ₁	-2.2×10^{-3}	9.4×10^{-4}	0.999997
A4	a ₁	-2.1×10^{-3}	-7.5×10^{-5}	0.999998
A5	a ₁	-2.0×10^{-4}	3.3×10^{-5}	> 0.9999995
A6	a ₁	1.3×10^{-4}	-1.7×10^{-6}	> 0.9999995
A7	a ₁	1.1×10^{-4}	6.1×10^{-5}	> 0.9999995
A9	a ₁	4.6×10^{-3}	1.2×10^{-4}	0.999989
B1	a ₁	-7.0×10^{-5}	-1.0×10^{-5}	> 0.999995
B2	a ₁	3.8×10^{-4}	1.7×10^{-5}	> 0.9999995
