

Sustainability Studies for Future Linear Colliders.

Making the next generation of accelerators more sustainable

Benno List¹, S. Michizono², T. Saeki², S. Stapnes³, M. Titov⁴. ¹DESY, ²KEK, ³CERN, ⁴CEA Saclay/Irfu

International Linear Collider ILC

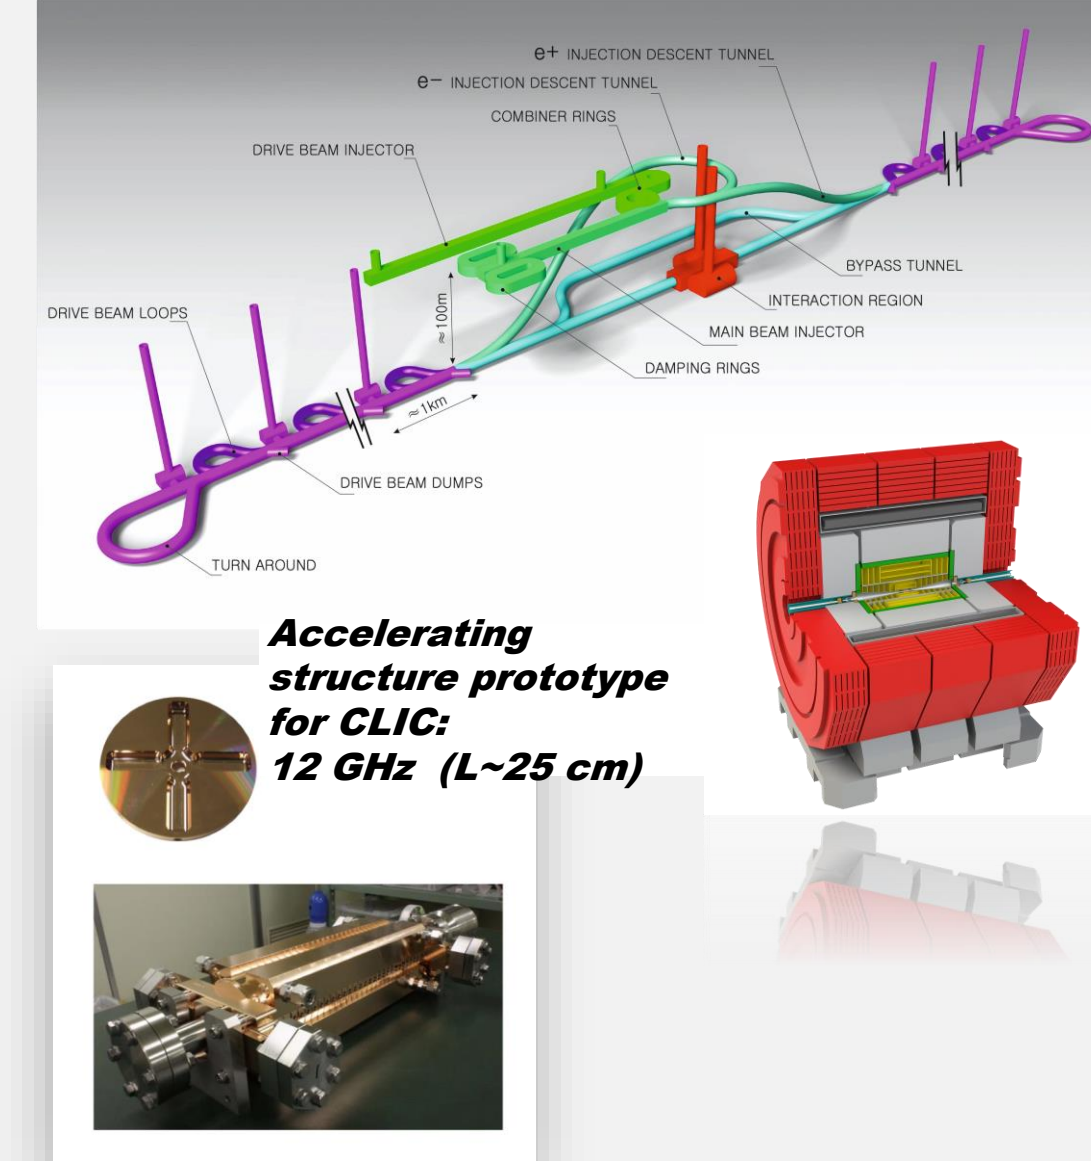

Item	Parameters
C.M. Energy	250 GeV
Length	20km
Luminosity	$1.35 \times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$
Repetition	5 Hz
Beam Pulse Period	0.73 ms
Beam Current	5.8 mA (in pulse)
Beam size (y) at FF	7.7 nm @ 250GeV
SRF Cavity G.	31.5 MV/m (35 MV/m)
Q_0	1×10^{10}

- Proposed Higgs factory in Tohoku (Japan), 250GeV initial energy
- Superconducting Main Linac for energy efficiency
- Timeline: 4 year preparation + 10 years construction -> operation 2037
- Expandable to 1TeV
- Cost: 6.3 – 7.0 B\$, including human resources
- Power: 111 MW at 250GeV

Compact Linear Collider CLIC

- Timeline:** Electron-positron linear collider at CERN for the era beyond HL-LHC
- Compact:** Novel and unique two-beam accelerating technique with high-gradient room temperature RF cavities (~20/500 structures at 380 GeV), ~11km in its initial phase
- Expandable:** Staged programme with collision energies from 380 GeV (Higgs/top) up to 3 TeV (Energy Frontier)
- CDR in 2012 with focus on 3 TeV. Updated project overview documents in 2018 (Project Implementation Plan) with focus 380 GeV for Higgs and top.
- Cost: 5.9 BCHF for 380 GeV
- Power: 110 MW at 380 GeV corresponding to ~50% of CERN's energy consumption today
- Comprehensive Detector and Physics studies

SUSTAINABLE DEVELOPMENT GOALS

In 2015, the UN adopted "2030 Agenda for Sustainable Development" with 17 goals, addressing economy, society and environment. Global accelerator projects contribute to many of these goals, including fostering peace and understanding and education.

Considering the full lifecycle of a product, facility or system is crucial for the evaluation and overall optimisation of its impact to the environment, society and economy.

Before Use stage (pre-use)	Use stage (in-use)	End of Use stage (post-use)	Benefits and Loads beyond the system boundary (B/L)
A0 Preliminary studies	B1 Use	C1 Decommission/Generation	Positive: Recycling Results and loads of additional infrastructure functions
A1 Raw material supply	B2 Maintenance	C2 Transport for Disposal	
A2 Transport	B3 Replacement	C3 Waste Processing for recovery	
A3 Manufacture	B4 Refurbishment	C4 Disposal	
A4 Transport to work site	B5 Operational Energy Use		
A5 (AS&A) Construction process	B6 Operational Water Use		
	B7 Use of infrastructure		

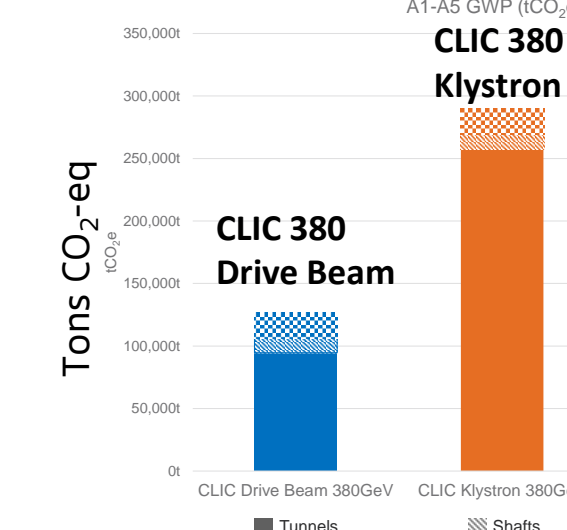

Lifecycle Stages according to BS EN 17472: Sustainability of construction works – Sustainability assessment of civil engineering works – Calculation methods.

CLIC Drive Beam, 380GeV

Material Impact Category	Absolute	Unit
Global warming	1,2758	kg CO ₂ eq
Greenhouse gases depletion	86	kg GWP eq
Acidification	6,667	kg SO ₂ eq
Fine particulate matter formation	2,2155	kg PM2.5 eq
Ozone formation - Human health	1,1165	kg NO _x eq
Ozone formation - Terrestrial bioturbation	2,8855	kg NO _x eq
Water resource depletion	2,8455	kg H ₂ O eq
Freshwater eutrophication	2,8654	kg P eq
Marine eutrophication	3,1153	kg N eq
Terrestrial eutrophication	4,0258	kg P eq
Freshwater eutrophication	4,3156	kg P eq
Marine eutrophication	5,2257	kg P eq
Human metabolism	6,7867	kg H ₂ O eq
Land use	9,9758	kg eq
Mineral resource scarcity	1,2265	kg eq
Fossil resource scarcity	2,1467	kg eq
Water consumption	1,2158	kg eq

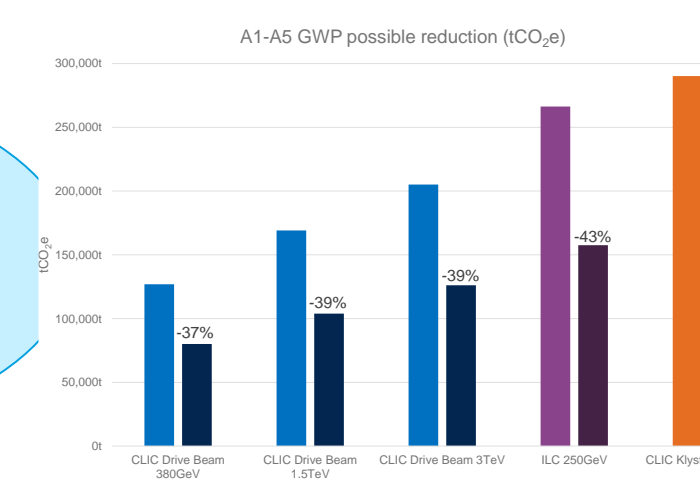

Impact categories according to the RCiPe Midpoint(H) 2016 method.

Considering more impact categories in addition to Global Warming Potential (GWP) is crucial for trade-off studies, e.g. in the case of permanent magnets which require problematic materials such as rare earths.

Result of a comparative Lifecycle Assessment (LCA) for the construction stages (A1-A5) of the CLIC and ILC underground civil engineering structures (tunnels, caverns, and shafts) according to BS EN 17472. ARUP 2023

Global Warming Potential

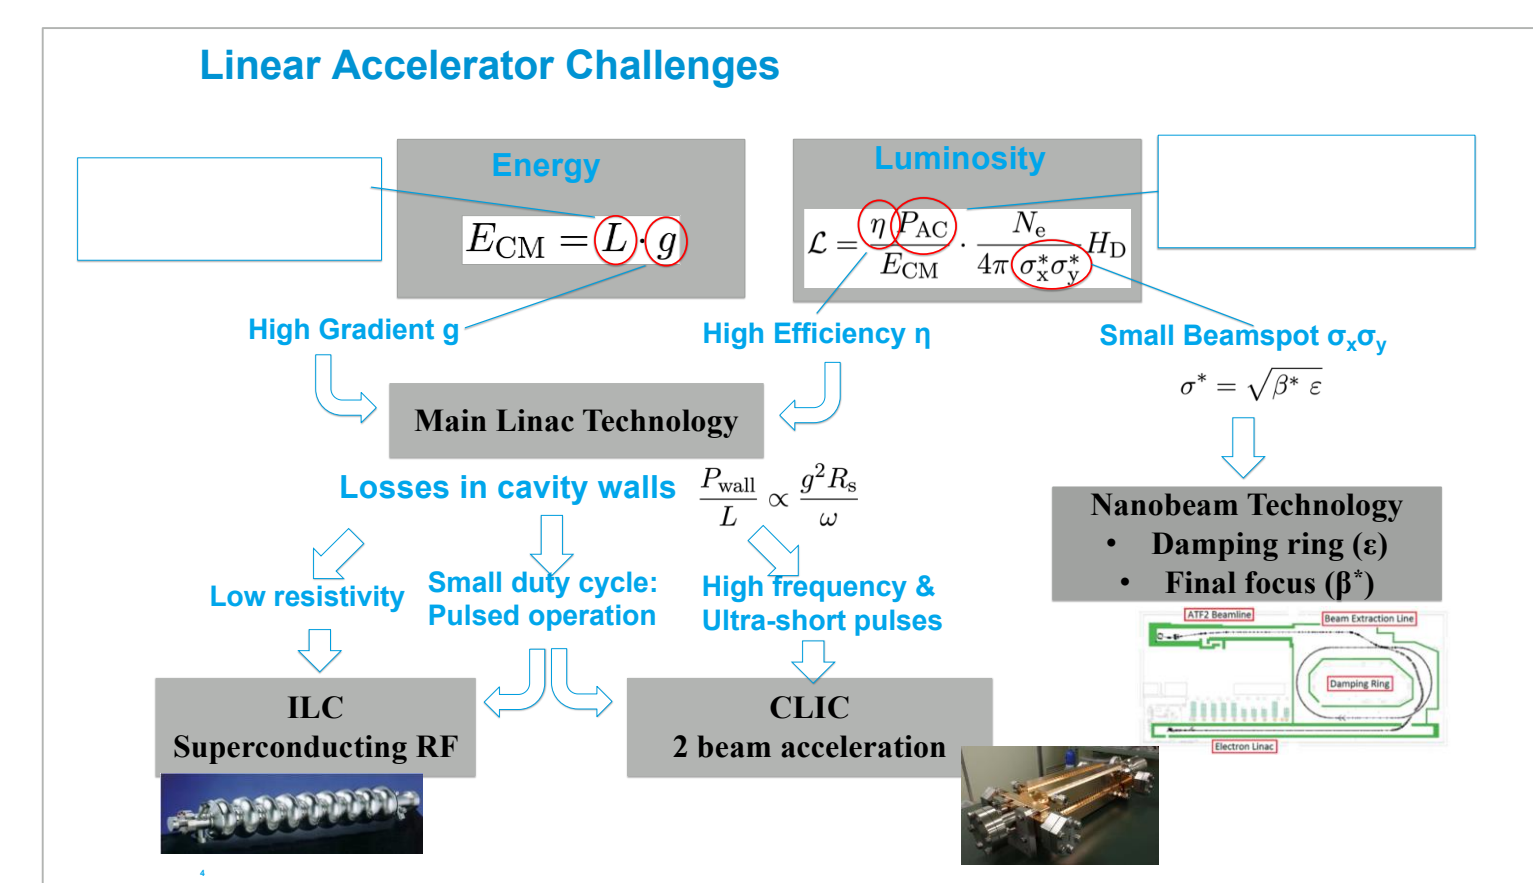

The lifecycle assessment of CLIC and ILC tunnels identified reduction potentials around 40%, e.g. through

- Use of less CO2 intensive materials
- Reduction of tunnel lining thickness

OUR COMMON FUTURE
Development that meets the needs of current generations without compromising the ability of future generations to meet their needs and aspirations. (WCED, 1987)

WCED (World Commission for Environment and Development) (1987) *Our Common Future*, Oxford University Press, Oxford.

Sustainability comprises environmental, economic and social dimension. For a project to be sustainable, all dimensions need to be considered and balanced.

Optimize the overall systems design with respect to costs (monetary or environmental cost) while keeping the key performance indicators as required.

A scan of the CLIC parameter space was performed to find the optimal combination of parameters such as cavity gradient, iris, cells per structure, etc. Ref: arXiv:1608.07537, Sec. 3.3, and CLIC-Note-1031

LCA of a conventional resistive electromagnet

- steel 201kg
- copper 52kg
- electricity 1140 kgCO₂e/year
- cooling 340 kgCO₂e/year

LCA of a corresponding permanent magnet

- NiFeB 1097kg
- aluminum 210kg
- steel 91kg

Replacing resistive electromagnets by permanent magnets has a large potential to reduce power consumption. The ZEPTO project has successfully produced and tested tuneable permanent magnet quadrupoles. It is important to consider the full lifecycle to assess whether the savings are beneficial overall. Ref: B. Shepherd, ESSRI workshop 2022.

SUSTAINABILITY

- Goals
- Definition
- Full Lifecycle
- Follow Standards
- Impact Categories
- Lifecycle Assessment
- Reduce Impacts
- Global Warming Potential
- System Design
- Operation
- Components
- Magnets
- Cavities
- Klystrons

Professional Lifecycle Assessment (LCA) studies consider the full lifecycle of a project in conformance to international standards. One such study on the underground civil facilities was performed by the ARUP company on behalf of CLIC and ILC. ARUP 2023

Optimisation of key components for better performance, efficiency and waste during production reduces the overall environmental impact of the project. Lifecycle assessments help in balancing overall costs, CO2 and other impacts such as ecotoxicity or resource scarcity.

R&D pushes performance of superconducting cavities

New materials (Nb3Sn) and new surface treatments (shown here: mid-RT bake (Grassellino et al arXiv:1806.09824)) make it possible to obtain higher gradients with lower cryogenic losses at lower cost and/or (for Nb3Sn) at higher temperature. This leads to

- Reduced raw material use,
- Reduced use of chemicals for electro polishing
- Reduced cryogenic power

Efficiency performance of the selected commercial klystrons and the new HE klystrons.

Development of high-efficiency klystrons based on novel beam optics (Core Stabilisation Method, Core Oscillation Method, Two Stage) greatly improves output power and efficiency of klystrons, reducing the energy demand of accelerators.

Prototype of 8MW high-efficiency X-band klystron CERN – Canon, CLIC-Note-1176
