

# Searching for heavy neutral leptons through exotic Higgs decays

July 2024

**Simon Thor<sup>1</sup>, Masaya Ishino<sup>2</sup>, Junping Tian<sup>2</sup>**

<sup>1</sup>KTH Royal Institute of Technology, Sweden

<sup>2</sup>International Center for Elementary Particle Physics, University of Tokyo, Japan

# Higgs as probe of BSM

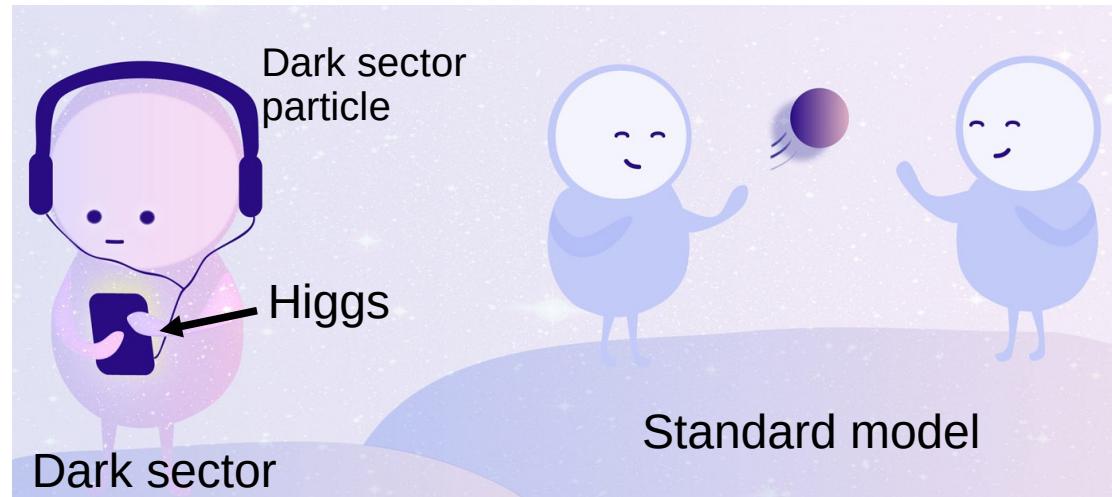

- No signs of BSM yet (except neutrino mass)

# Higgs as probe of BSM

- No signs of BSM yet (except neutrino mass)
- Higgs boson one of the least understood SM particles

# Higgs as probe of BSM

- No signs of BSM yet (except neutrino mass)
- Higgs boson one of the least understood SM particles
  - Might be connected to BSM, e.g., a dark sector
- Precision measurements of Higgs could lead to discoveries

# Heavy neutral leptons

- Also known as sterile neutrinos, dark neutrinos etc.

# Heavy neutral leptons

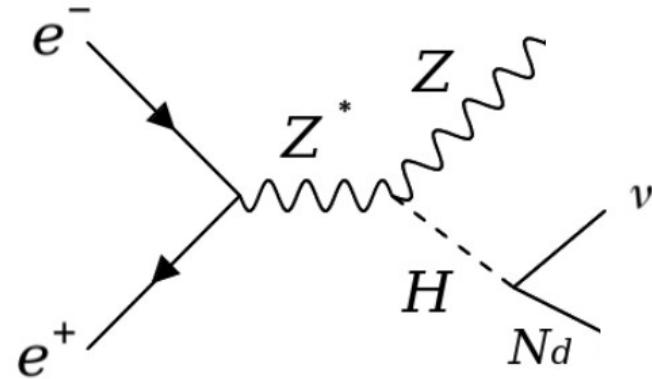

- Also known as sterile neutrinos, dark neutrinos etc.
- Various models
  - Majorana particle that gives neutrinos mass via Type-I Seesaw mechanism
  - Dark sector model with  $SU(2)_D$  that result in matter- antimatter asymmetry [arXiv:1910.08068]

# Heavy neutral leptons

- Also known as sterile neutrinos, dark neutrinos etc.
- Various models
  - Majorana particle that gives neutrinos mass via Type-I Seesaw mechanism
  - Dark sector model with  $SU(2)_D$  that result in matter- antimatter asymmetry [arXiv:1910.08068]
- In this study:  $m_Z < m_{N_d} < m_H$

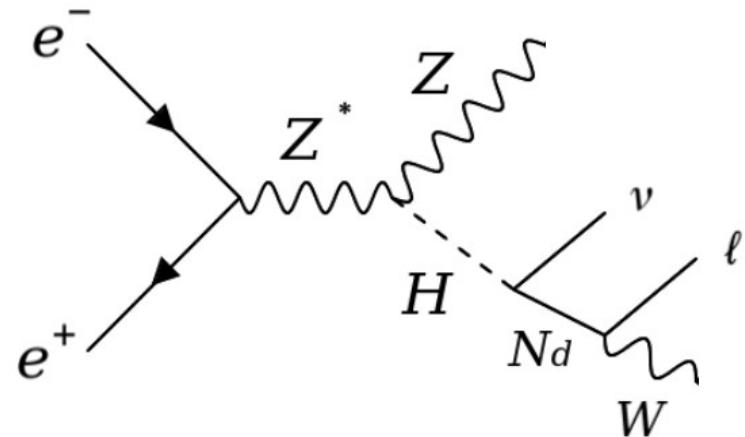

# BSM signal

- Exotic Higgs decay:  $H \rightarrow \nu N_d$

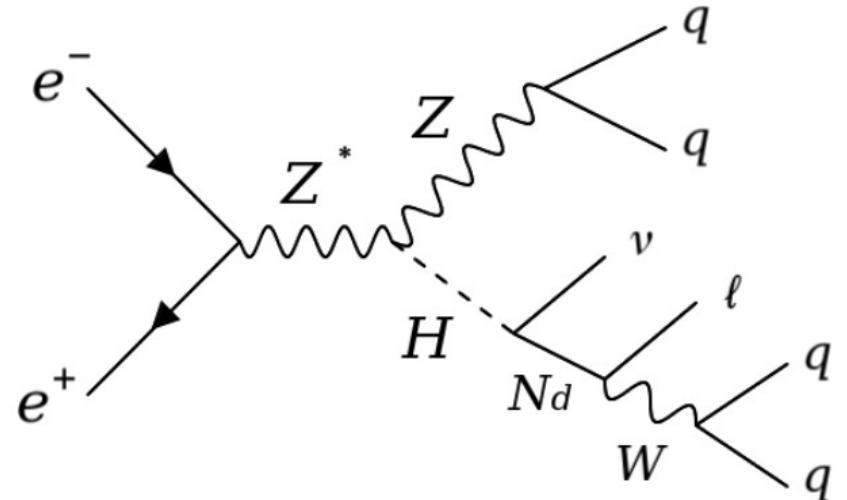

# BSM signal

- Exotic Higgs decay:  $H \rightarrow \nu N_d$
- Only e,  $\mu$  channels

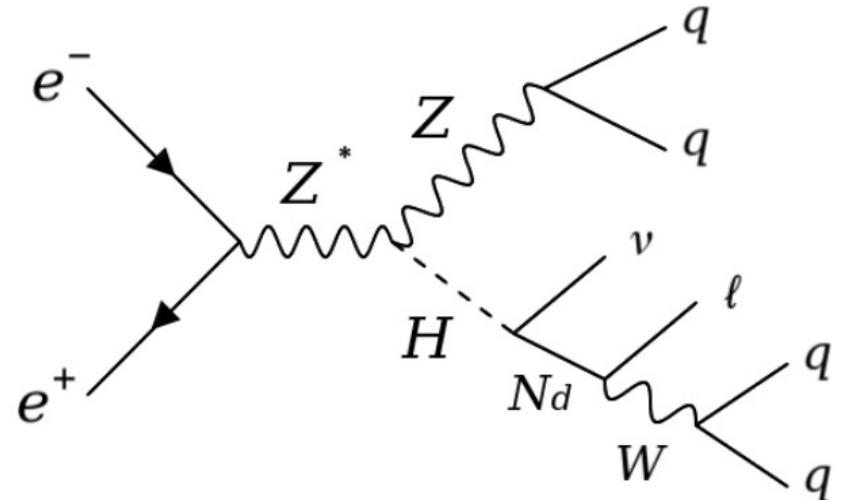

# BSM signal

- Exotic Higgs decay:  $H \rightarrow \nu N_d$
- Only  $e, \mu$  channels
- Focus on hadronic decay mode

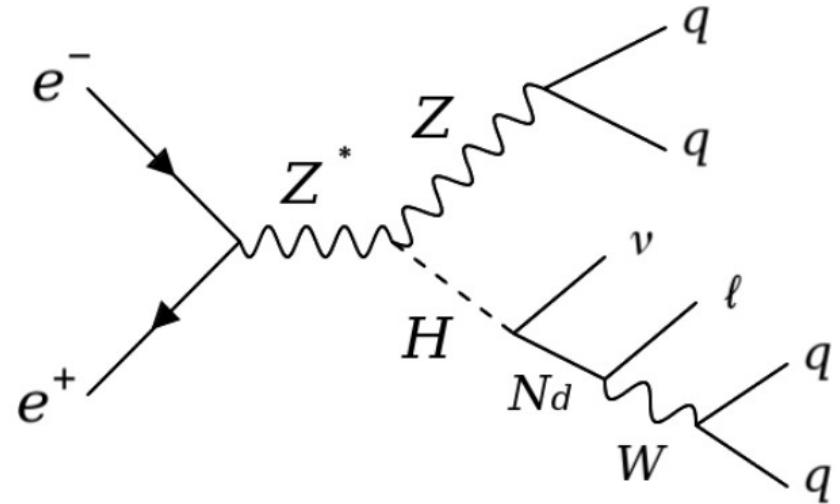

# BSM signal

- Exotic Higgs decay:  $H \rightarrow \nu N_d$
- Only  $e, \mu$  channels
- Focus on hadronic decay mode
- Signal characteristics:
  - 4 jets
  - 1 isolated lepton
  - Missing 4-momentum

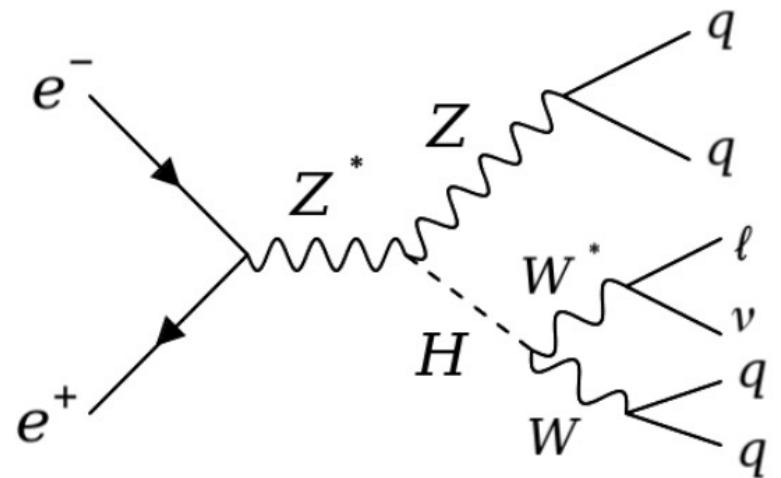

# BSM signal

- Exotic Higgs decay:  $H \rightarrow \nu N_d$
- Only  $e, \mu$  channels
- Focus on hadronic decay mode
- Signal characteristics:
  - 4 jets
  - 1 isolated lepton
  - Missing 4-momentum
- Free parameters: HNL mass,  $\text{BR}(H \rightarrow \nu N_d) \text{BR}(N_d \rightarrow l W)$

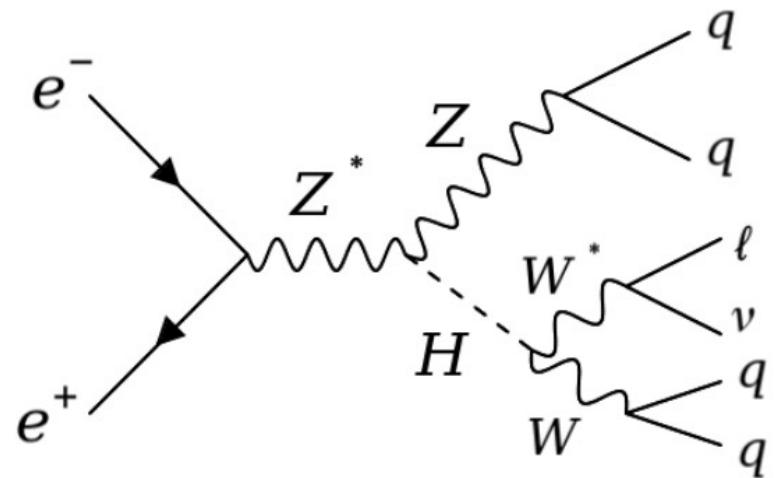

# Dominant background

- Same final state as signal

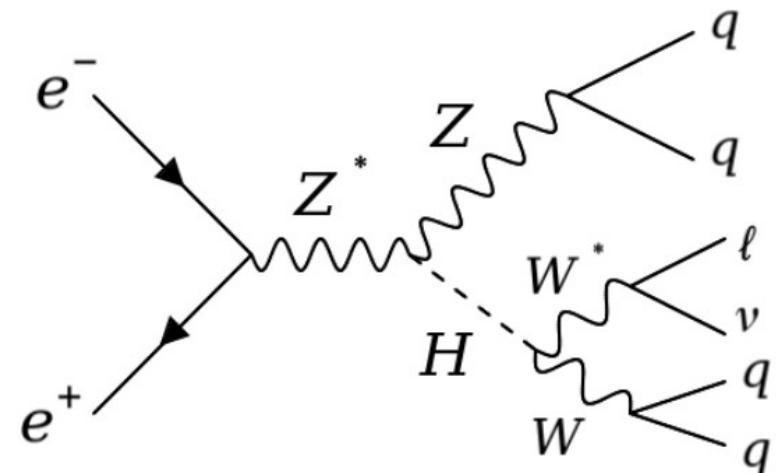

# Dominant background

- Same final state as signal
- Also includes a W boson
  - Problem for invariant mass reconstruction

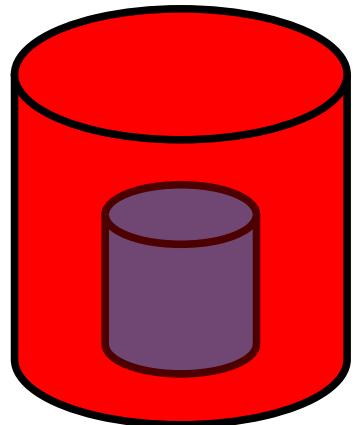

# Dominant background

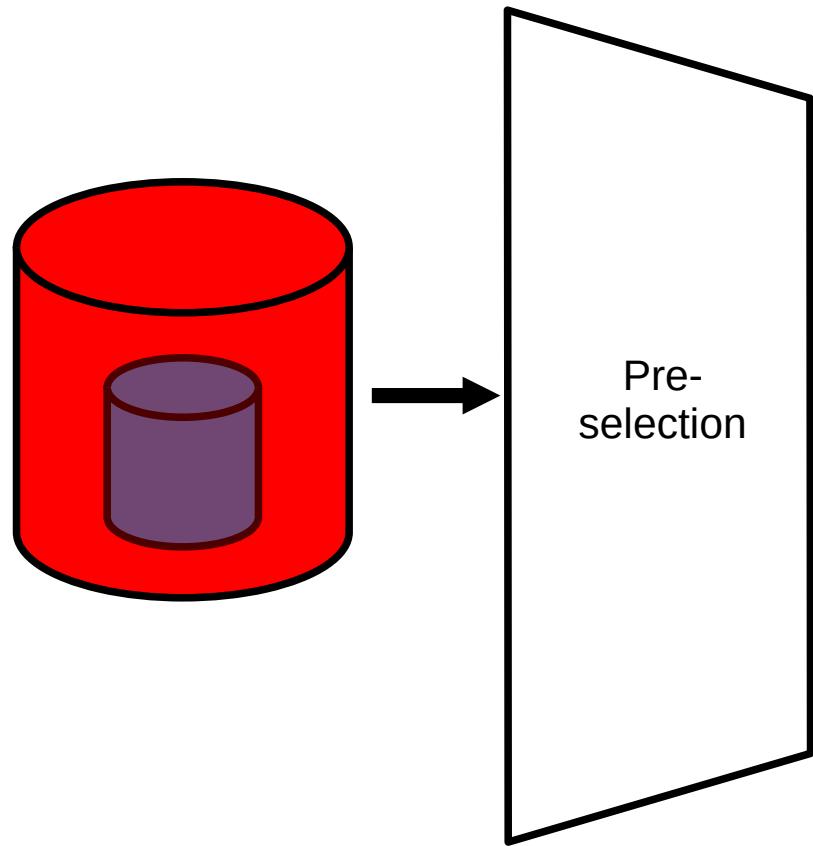

- Same final state as signal
- Also includes a W boson
  - Problem for invariant mass reconstruction
- $W^*$  can be used for filtering this background

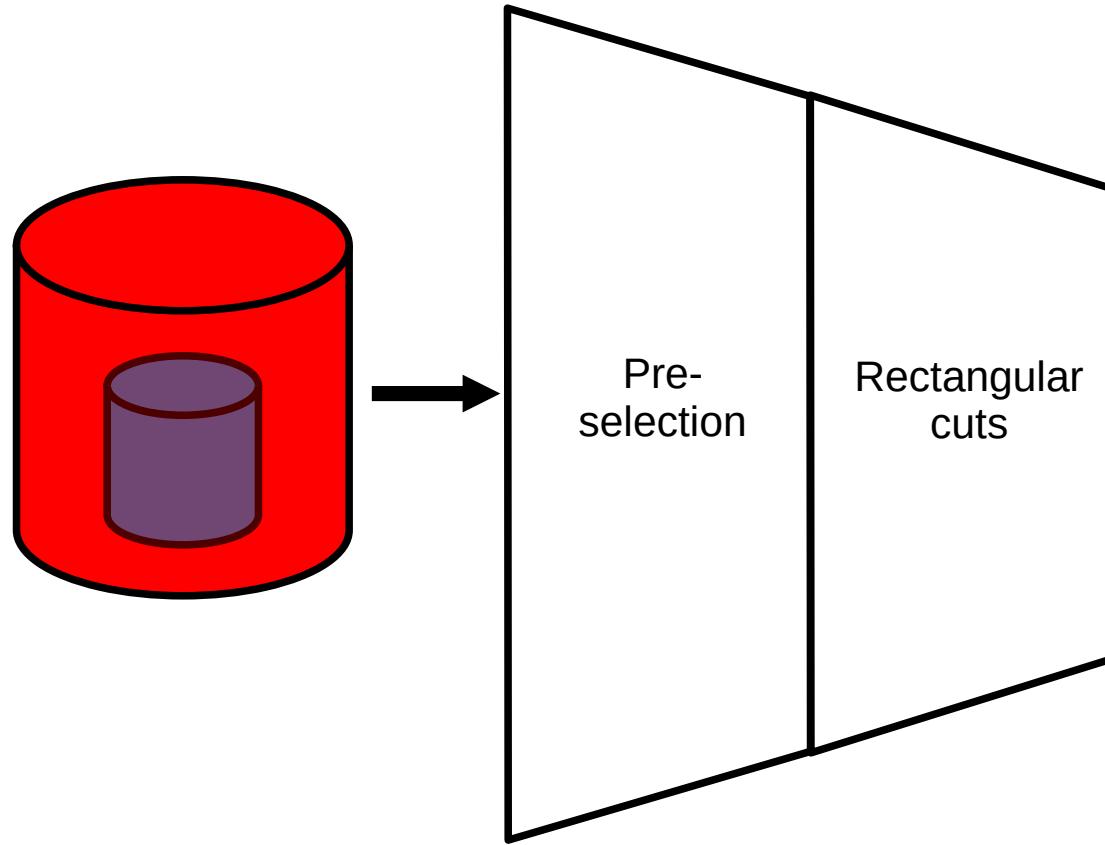

# Method

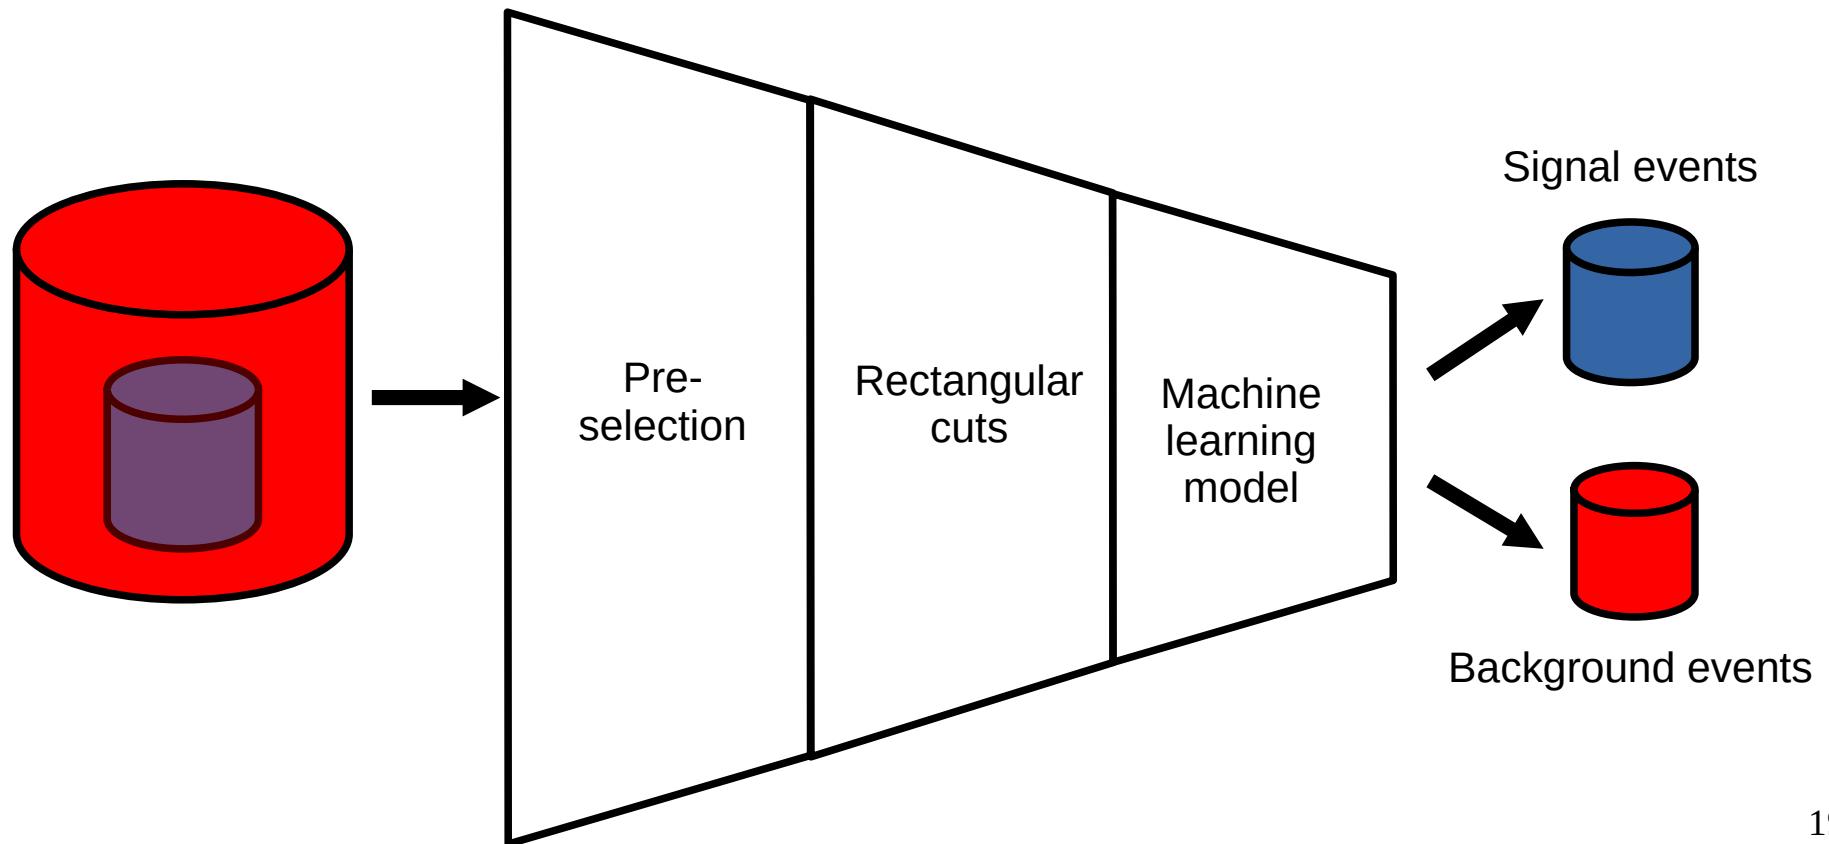

# Method

# Method

# Method

# Dataset

- Full detector (ILD) simulations
  - Whizard (event generation) → Pythia (parton shower + hadronization)  
→ Geant4 (detector simulation) → Marlin (reconstruction)

# Dataset

- Full detector (ILD) simulations
  - Whizard (event generation) → Pythia (parton shower + hadronization)  
→ Geant4 (detector simulation) → Marlin (reconstruction)
- $1000 \text{ fb}^{-1}$  each of beam polarization (-0.8, +0.3), (+0.8, -0.3)

# Dataset

- Full detector (ILD) simulations
  - Whizard (event generation) → Pythia (parton shower + hadronization)  
→ Geant4 (detector simulation) → Marlin (reconstruction)
- $1000 \text{ fb}^{-1}$  each of beam polarization (-0.8, +0.3), (+0.8, -0.3)
- $\sqrt{s} = 250 \text{ GeV}$
- Aligns with currently proposed configuration of ILC

# Dataset

- Full detector (ILD) simulations
  - Whizard (event generation) → Pythia (parton shower + hadronization)  
→ Geant4 (detector simulation) → Marlin (reconstruction)
- $1000 \text{ fb}^{-1}$  each of beam polarization (-0.8, +0.3), (+0.8, -0.3)
- $\sqrt{s} = 250 \text{ GeV}$
- Aligns with currently proposed configuration of ILC

## Signal

- $m_{N_D} = 95, 100, 105, 110, 115, 120 \text{ GeV}$
- $\sim 200\,000$  events per mass per beam polarization

# Pre-selection

- Require at least one isolated lepton (neural network)
  - Muon: lepton finder output  $> 0.5$
  - Electron: lepton finder output  $> 0.2$

# Pre-selection

- Require at least one isolated lepton (neural network)
  - Muon: lepton finder output  $> 0.5$
  - Electron: lepton finder output  $> 0.2$
- Cluster remaining particles to 4 jets with Durham clustering
- Pair jets to Z and W to minimize
$$\chi^2 = \left( \frac{m_W - m_{12,jet}}{\Delta m_{W,jet}} \right)^2 + \left( \frac{m_Z - m_{34,jet}}{\Delta m_{Z,jet}} \right)^2$$
- Mass resolution calculated from invariant mass from MC truth jets

# Rectangular cuts

- Optimize cuts to maximize significance  $\sigma = s/\sqrt{s+b}$
- Separate cuts for each beam polarization, HNL mass

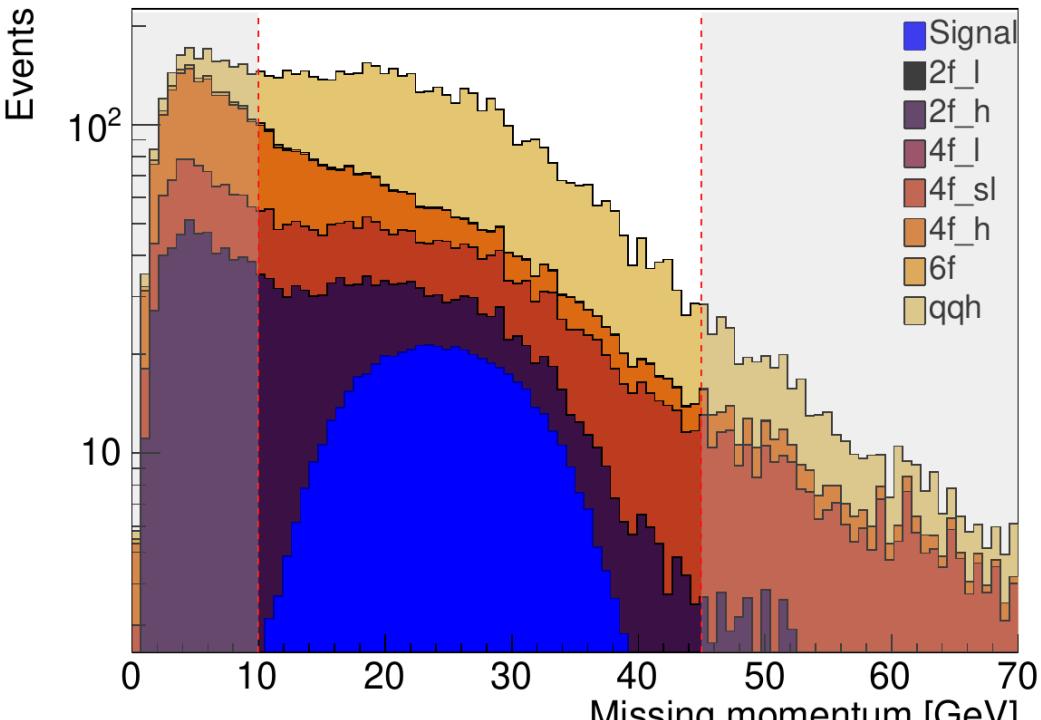

# Rectangular cuts

- Optimize cuts to maximize significance  $\sigma = s/\sqrt{s+b}$
- Separate cuts for each beam polarization, HNL mass

**Example** ( $m=100$  GeV,  $(+0.8, -0.3)$  beam polarization)

- $(\text{Lepton energy})/50 + (\text{missing energy})/100 < 1$
- Isolated lepton finder output  $> 0.6$
- $160 \text{ GeV} < 4\text{-jet invariant mass} < 220 \text{ GeV}$
- Durham jet distance  $y_{4 \rightarrow 3} > 0.004$  (if jets are more likely from 4 or 3 quarks)  
$$y_{4 \rightarrow 3} = \min_{i,j} \left\{ \frac{2 \min\{E_i, E_j\}^2 (1 - \cos(\theta_{ij}))}{E_{vis}^2} \right\}$$
- At least 4 particles in each jet
- $10 \text{ GeV} < \text{Missing momentum} < 45 \text{ GeV}$

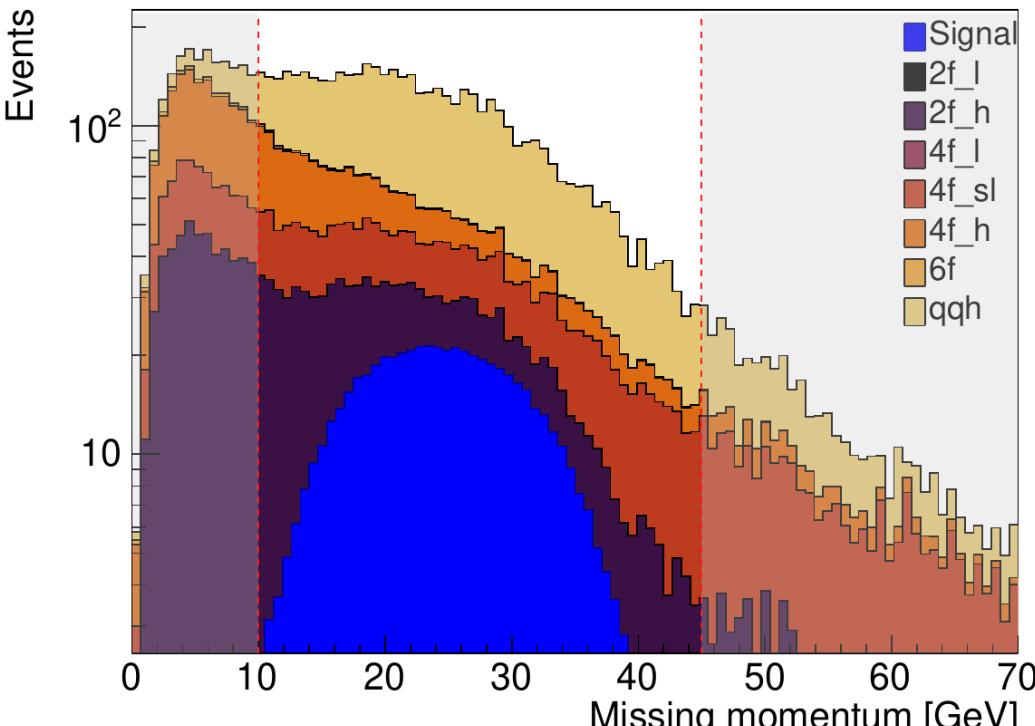

# Missing momentum cut

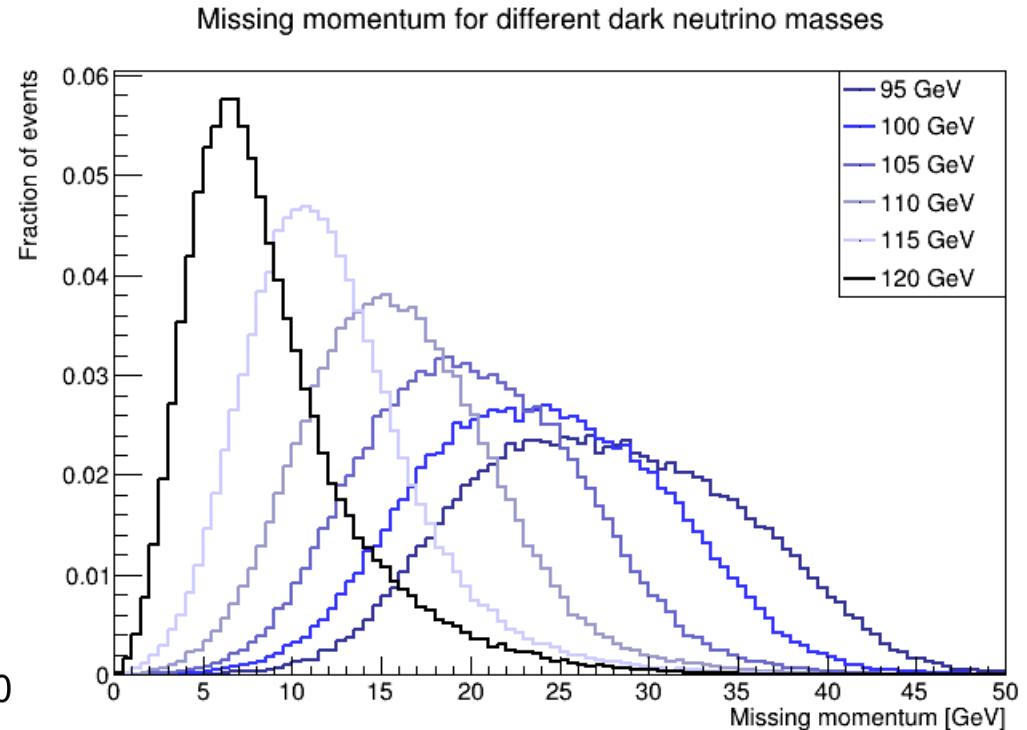

$m=100$  GeV, (+0.8, -0.3) beam polarization

# Missing momentum cut

- Differs significantly for different dark neutrino masses

m=100 GeV, (+0.8, -0.3) beam polarization

# Machine learning

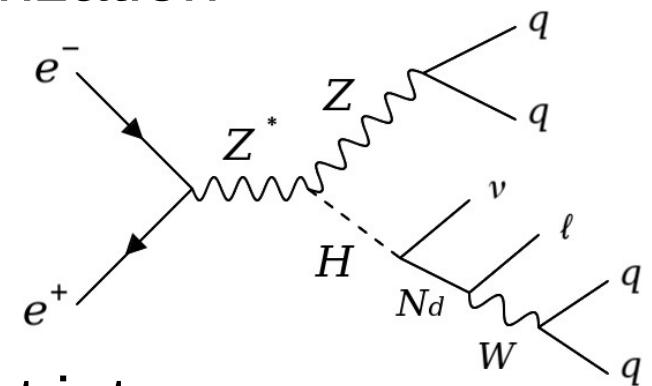

- Boosted decision tree
- Separate BDT for each mass, beam polarization

# Machine learning

- Boosted decision tree
- Separate BDT for each mass, beam polarization

## Input parameters

- Lepton energy, missing energy
- 4-jet combined momentum
- Angle between isolated lepton and closest jet
- Lepton, Missing 4-momentum, Z boson production angle
- Lepton helicity angle in dark neutrino rest frame
- Higgs, Z boson, W boson, dark neutrino invariant mass

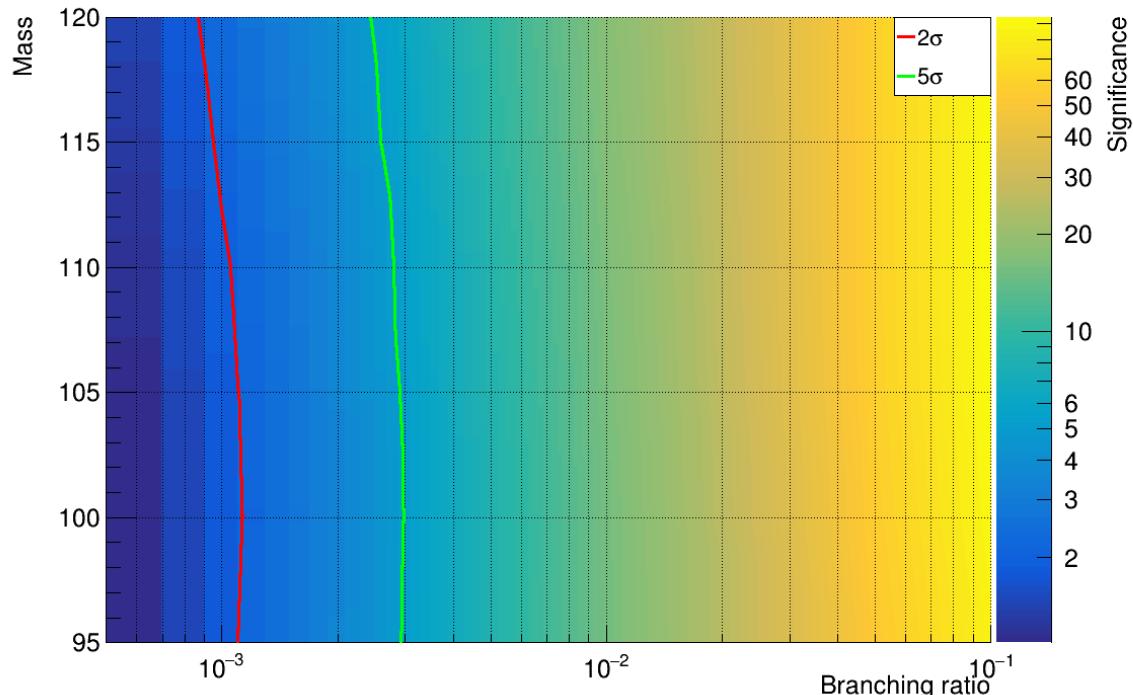

# Total significance

- Background reduced by factor of  $\sim 200\,000$
- $\sim 20\%$  of signal left

# Total significance

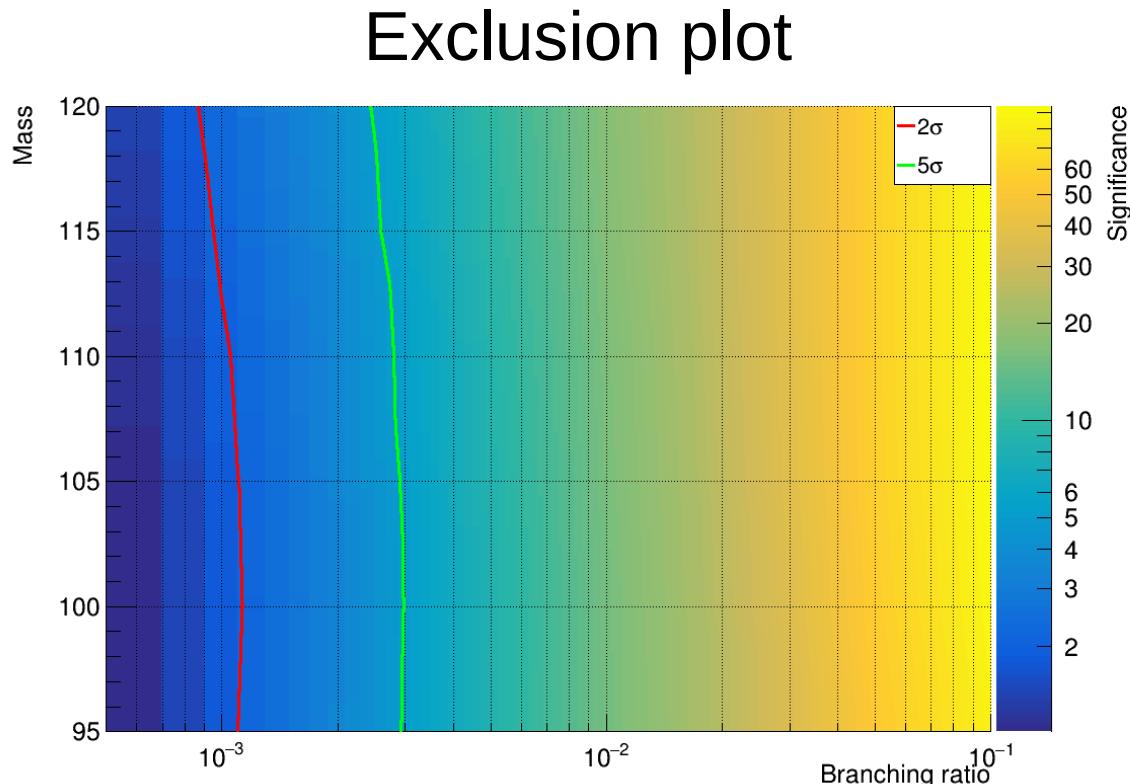

- Background reduced by factor of  $\sim 200\,000$
- $\sim 20\%$  of signal left
- H branching ratio can be probed down to **0.1%**

Exclusion plot

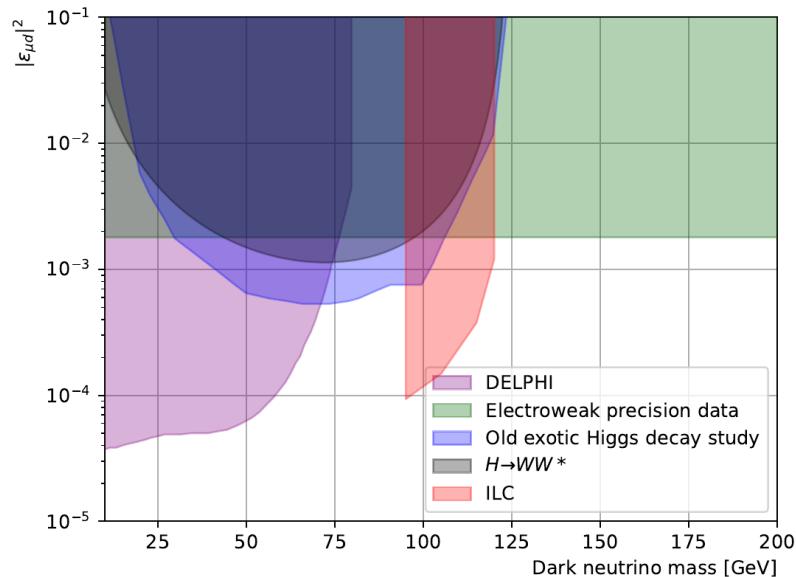

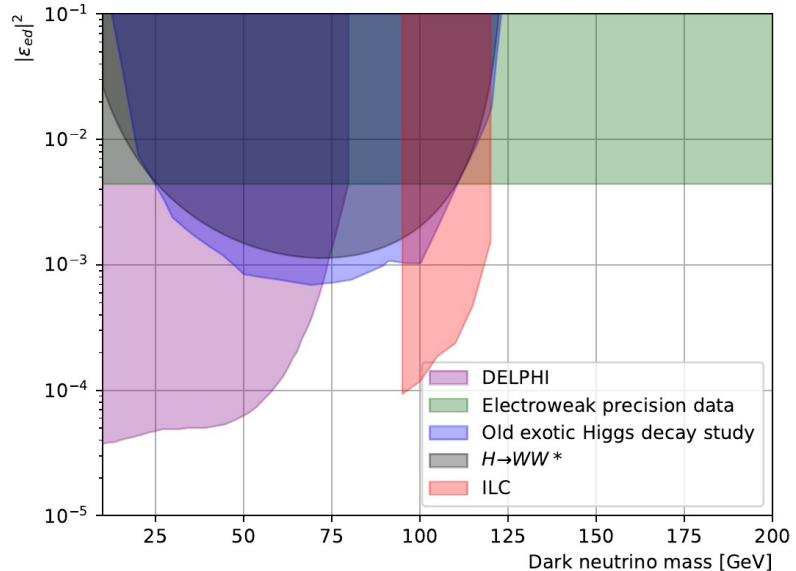

# Total significance

- Background reduced by factor of  $\sim 200\,000$
- $\sim 20\%$  of signal left
- H branching ratio can be probed down to **0.1%**
- By some estimates, BR measurements could be **25x** better than HL-LHC!

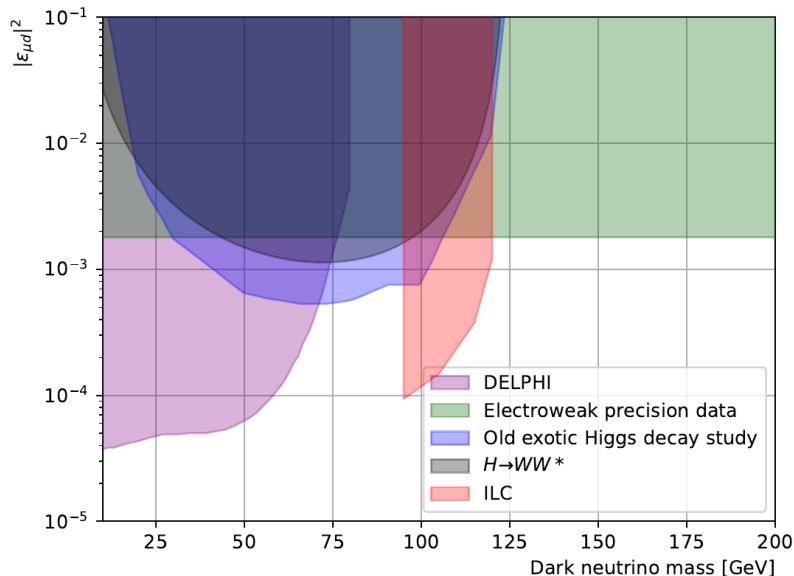

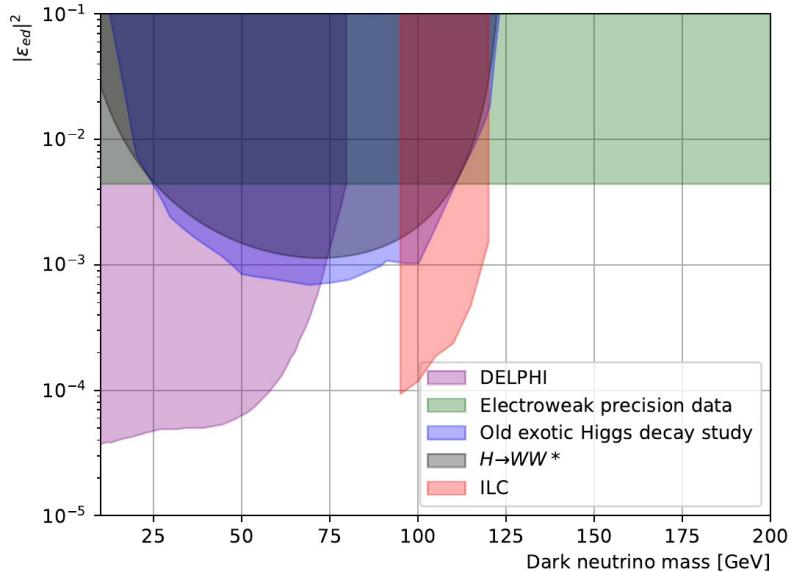

# Exclusion

- Convert branching ratio to mixing angle between SM neutrino and HNL

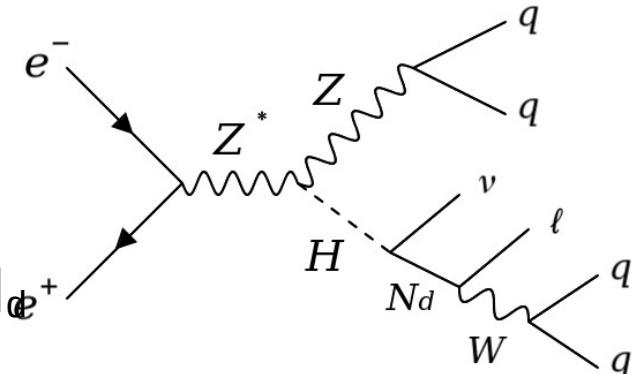

# Exclusion

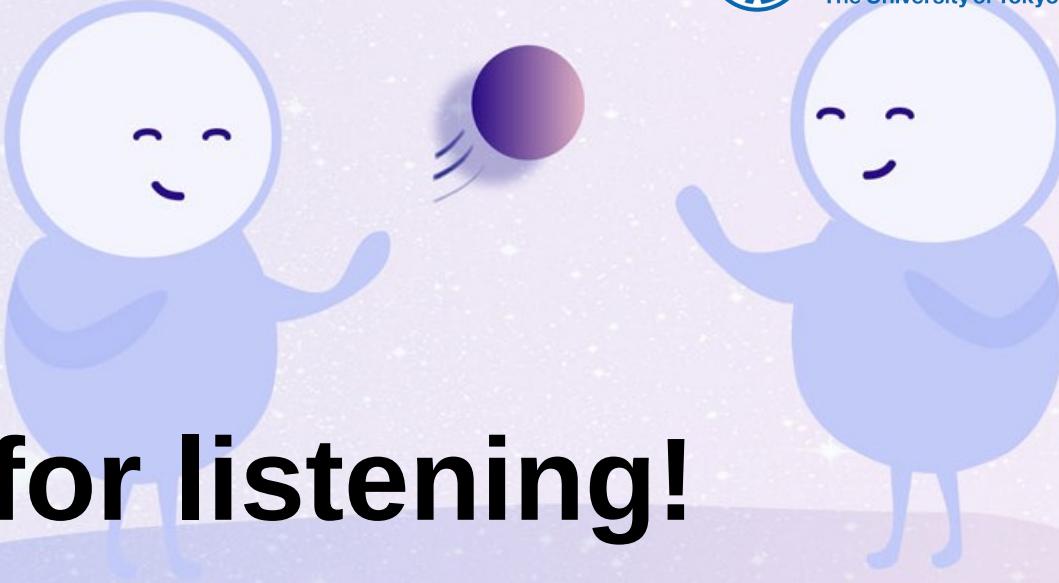

- Convert branching ratio to mixing angle between SM neutrino and HNL
- Exclusion improved by factor of 10 compared to current constraints (possibly more)

# Summary

- Study heavy neutral lepton model
- $m_Z < m_{N_d} < m_H$
- First ever full detector simulation for  $H \rightarrow N_d e^+$
- Rectangular cuts + machine learning
- Constrain  $\text{BR}(H \rightarrow \nu N_d) \text{BR}(N_d \rightarrow l W)$  to **0.1%** (at  $2\sigma$ )
- 25x higher significance compared to HL-LHC
  - **ILC allows for high precision measurements!**
- Preprint available: [arXiv:2309.11254](https://arxiv.org/abs/2309.11254)

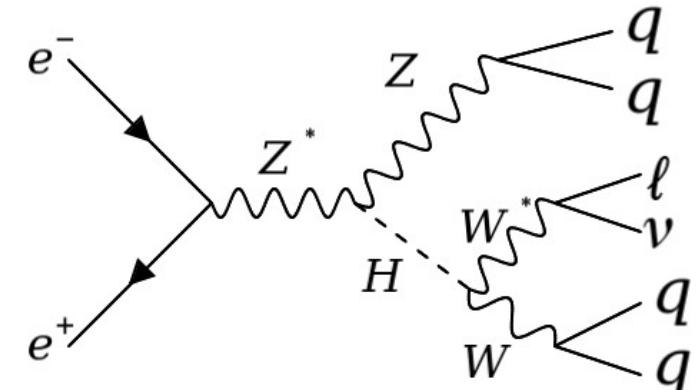

# Thank you for listening!

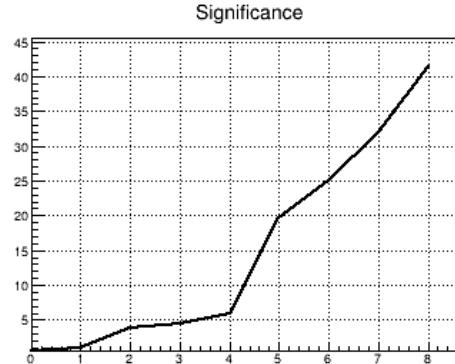

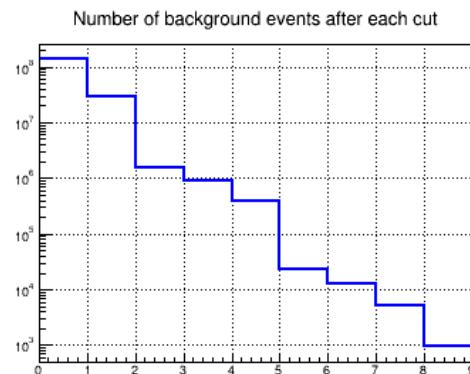

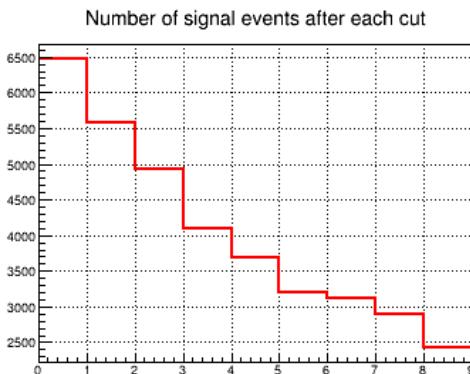

# Side outcome: $H \rightarrow WW^*$

- $H \rightarrow WW^* \rightarrow qq\bar{q}\nu$  dominant background
- $H \rightarrow WW^*$  interesting to study on its own
  - Key to Higgs total width
- Only investigate  $H \rightarrow WW^* \rightarrow qq\bar{q}\nu$  decay channel
- Same workflow as dark neutrino analysis
- Dark neutrino-related input parameters to BDT are removed
- No lepton channel separation (yet)

# Cut table | (-0.8, +0.3) beam

Number of signal events after each cut

Number of background events after each cut

Significance

# Significance

- Combined significance:  **$58\sigma$**
- Previous study of same decay channel at ILC (H. Ono):  $36\sigma$ 
  - Both  $W^* \rightarrow l\nu$  and  $W^* \rightarrow qq$  were used
- Previous study of  $H \rightarrow WW^*$  significance, with all decay modes:  $61\sigma$
- **Major improvement** of significance compared to previous studies at ILC

# Particles in dark sector

- Two Higgs doublets
- Higgs potential:

$$\begin{aligned}
 V(\Phi) = & \mu_1^2 \Phi_1^\dagger \Phi_1 + \mu_2^2 \Phi_2^\dagger \Phi_2 - \mu_3^2 (\Phi_1^\dagger \Phi_2 + c.c.) \\
 & + \frac{1}{2} \lambda_1 (\Phi_1^\dagger \Phi_1)^2 + \frac{1}{2} \lambda_2 (\Phi_2^\dagger \Phi_2)^2 + \lambda_3 (\Phi_1^\dagger \Phi_1)(\Phi_2^\dagger \Phi_2) + \lambda_4 (\Phi_1^\dagger \Phi_2)(\Phi_2^\dagger \Phi_1) \\
 & + \left[ \frac{1}{2} \lambda_5 (\Phi_1^\dagger \Phi_2)^2 + \lambda_6 (\Phi_1^\dagger \Phi_1)(\Phi_1^\dagger \Phi_2) + \lambda_7 (\Phi_1^\dagger \Phi_2)(\Phi_2^\dagger \Phi_2) + c.c. \right].
 \end{aligned}$$

- $\lambda_{5,6,7}$  are complex (CP violation)
- Left-handed  $L_{1u}$ ,  $L_{1d}$  with charge  $Q_1$
- Right-handed  $N_u$ ,  $N_d$  (dark neutrinos) with charge  $Q_1$
- $L_2$ : massless particle with charge  $Q_2$ 
  - Exists to counteract Witten's anomaly but not important

field	$SU(2)_D$	$\gamma_5$	$Q_1$	$Q_2$	$\mathbb{Z}_2$
$\Phi_{1,2}$	<b>2</b>	0	0	0	+
$L_1$	<b>2</b>	-1	+1	0	+
$N_{u,d}$	<b>1</b>	+1	+1	0	+
$L_2$	<b>2</b>	-1	0	+1	-

# Early universe

## I. Dark first-order phase transition in early universe

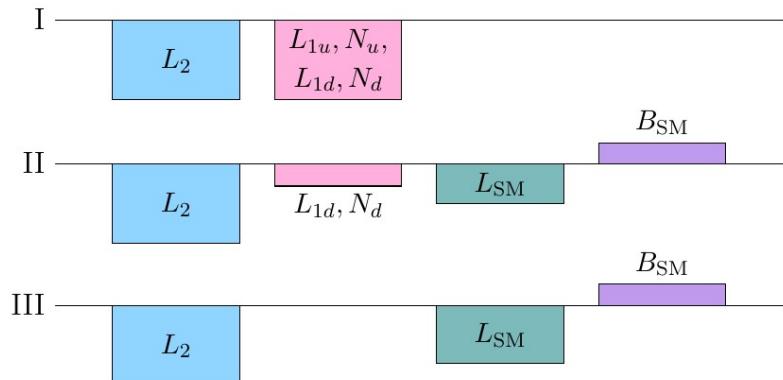

- More particles than antiparticles in dark sector

## II. $N_u$ decays to SM leptons

- $Q_1$  asymmetry converted to SM lepton asymmetry
- Some leptons converted to baryons through SM sphaleron

## III. After EW symmetry breaking, $N_d$ decays to SM leptons

→ additional lepton asymmetry

# Techincal details

- Use ROOT::RDataFrame in Jupyter notebook

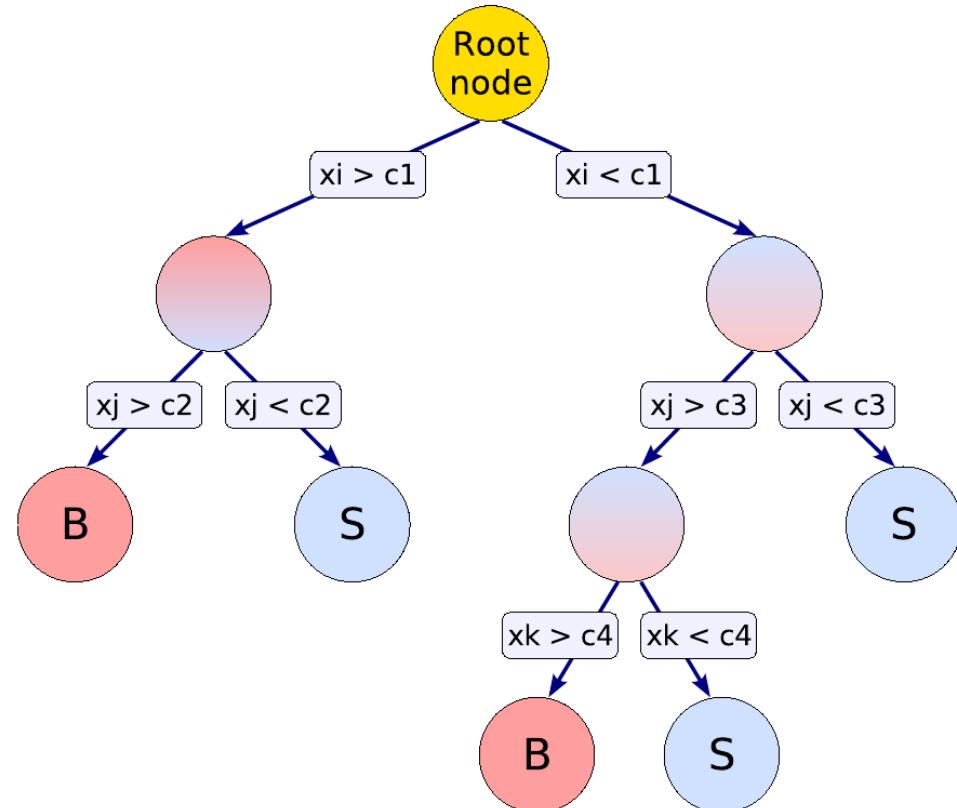

Simplifies:

- Making and analyzing cuts
- Defining new variables
- Running the code in parallel → performance boost
- Visualize the filtered data
- Exploratory data analysis

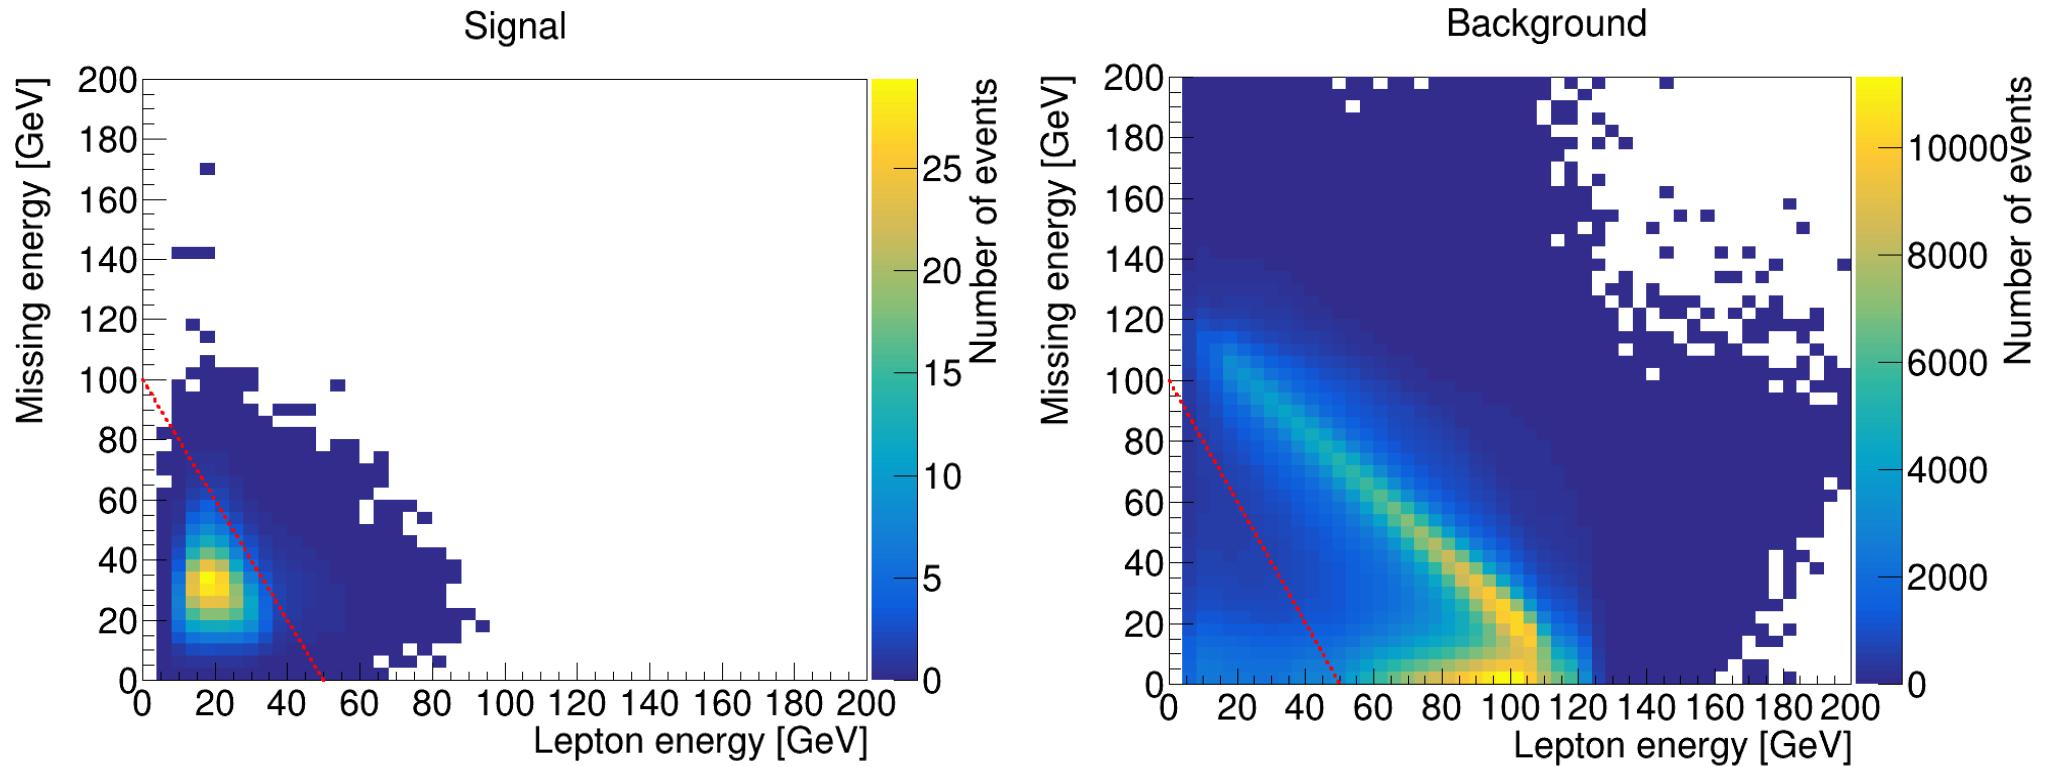

```
ROOT::RDataFrame df("myTree", file);
auto h = df.Filter("y > 2").Histo1D("x");
h->Draw()
```

# Boosted decision tree

- Multiple binary decision trees are trained
- When evaluating an event, the trees "vote" if the event is signal or background
- The BDT output is the weighted mean of all trees
- Events are reweighted such that signal and background is equal in size

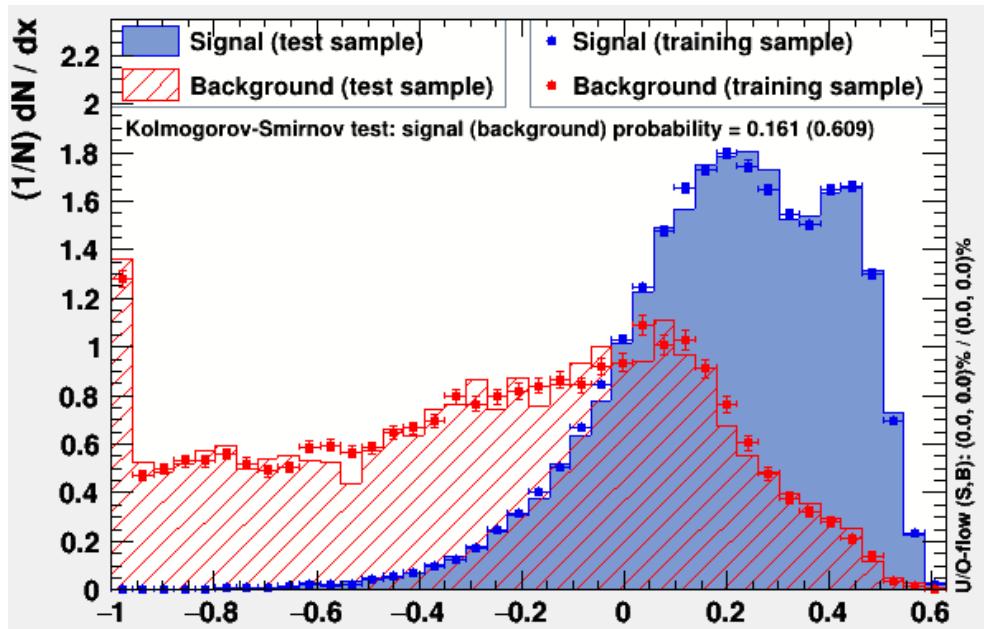

# Lepton/missing energy distribution

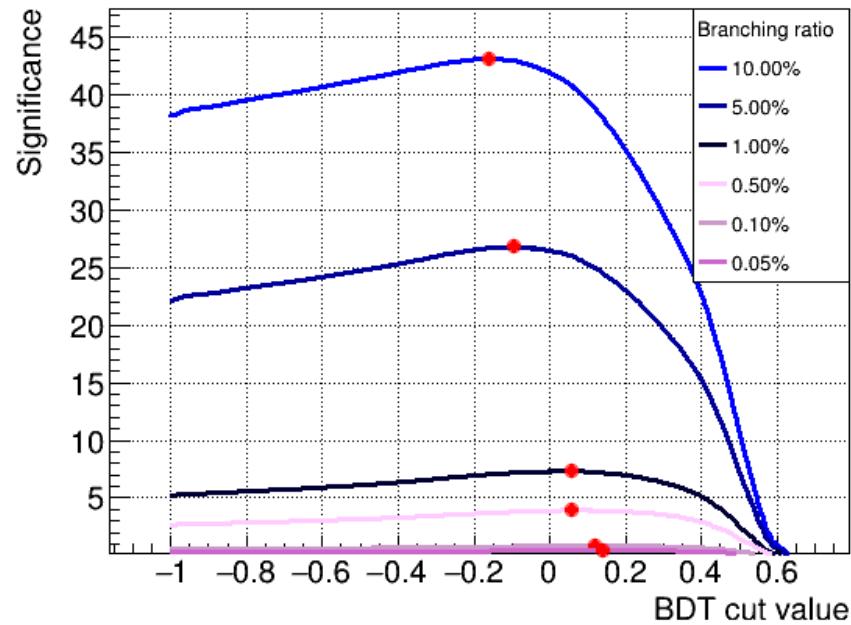

$m=100$  GeV,  $(+0.8, -0.3)$  beam polarization

# Machine learning output

- Confirm that BDT is not overtrained
- Find optimal BDT cut value to maximize significance

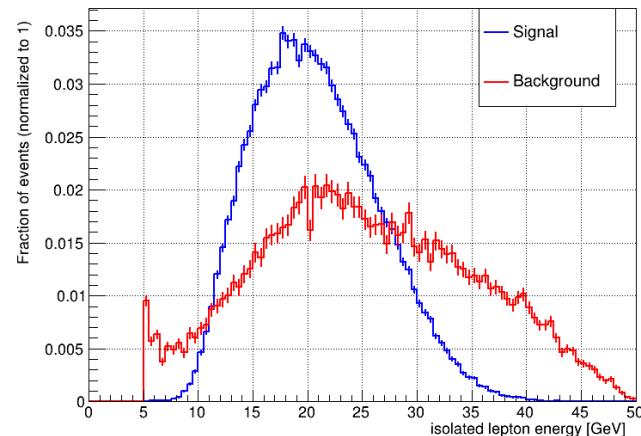

100 GeV dark neutrino mass, (-0.8, +0.3) beam polarization

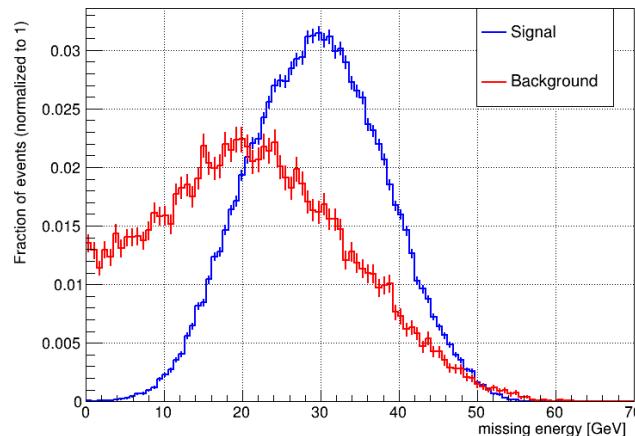

100 GeV dark neutrino mass, (-0.8, +0.3), e channel

# BDT parameter distributions - energies

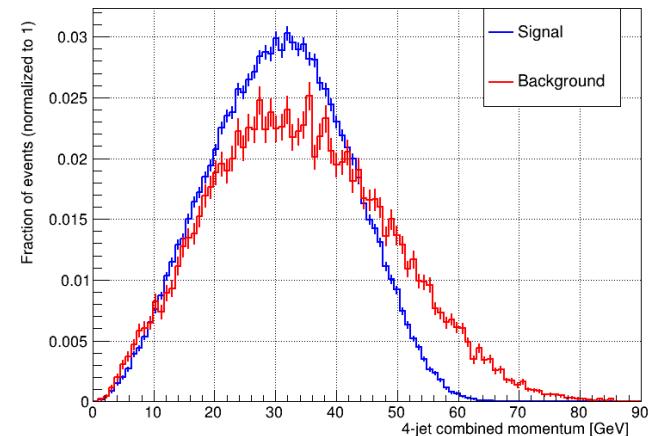

Signal vs background of isolated lepton energy [GeV]

Signal vs background of missing energy [GeV]

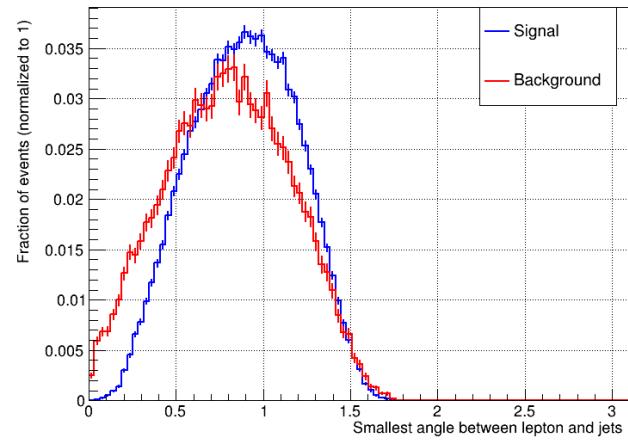

Signal vs background of 4-jet combined momentum [GeV]

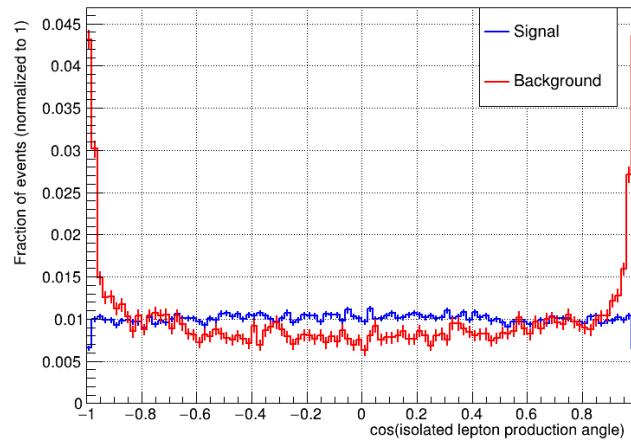

# BDT parameter distributions - angles

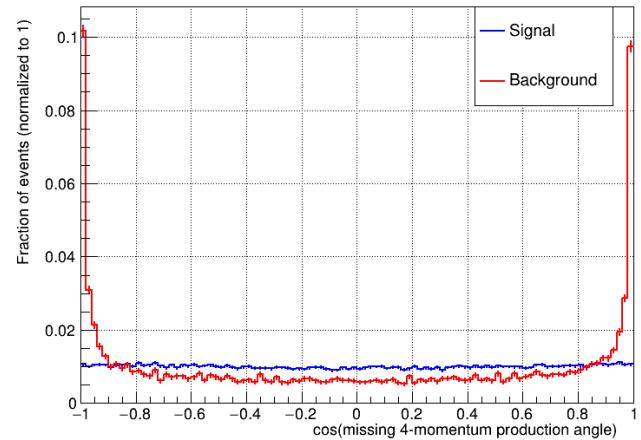

Signal vs background of Smallest angle between lepton and jets

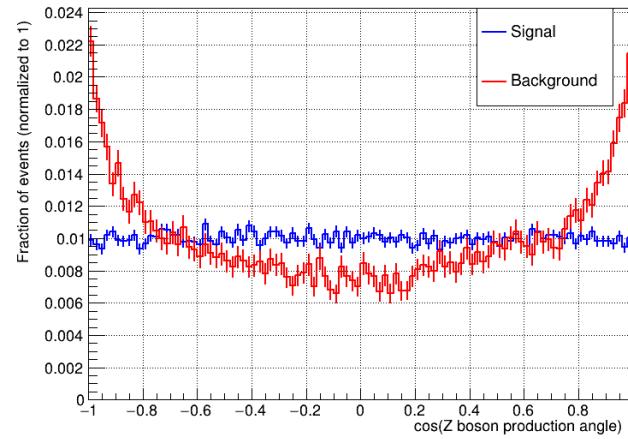

Signal vs background of cos(isolated lepton production angle)

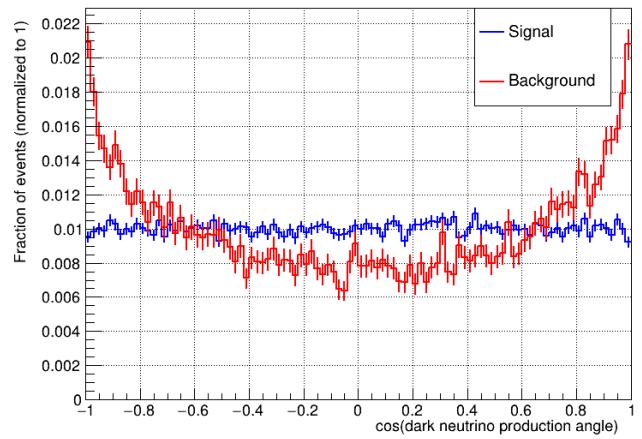

Signal vs background of cos(missing 4-momentum production angle)

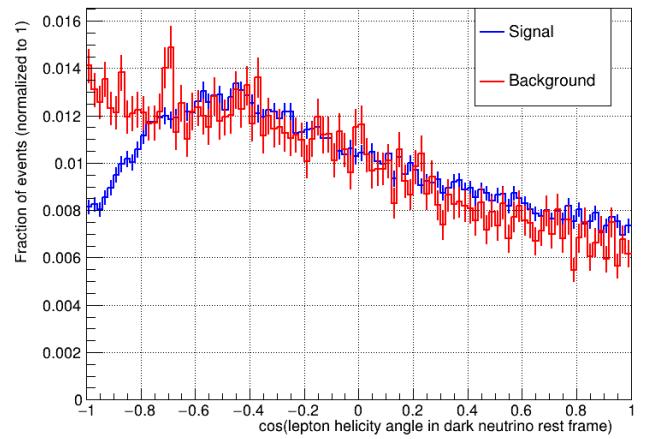

Signal vs background of  $\cos(Z \text{ boson production angle})$

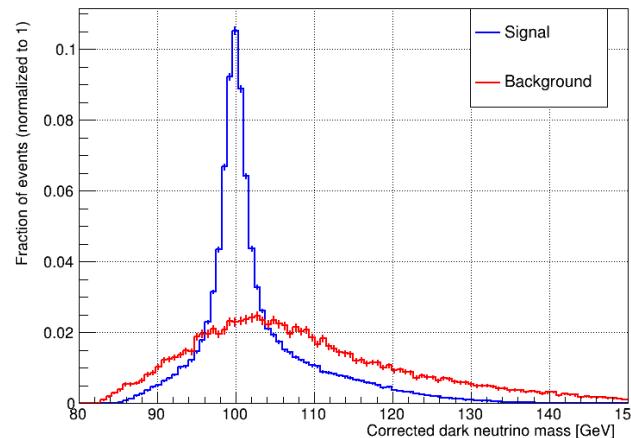

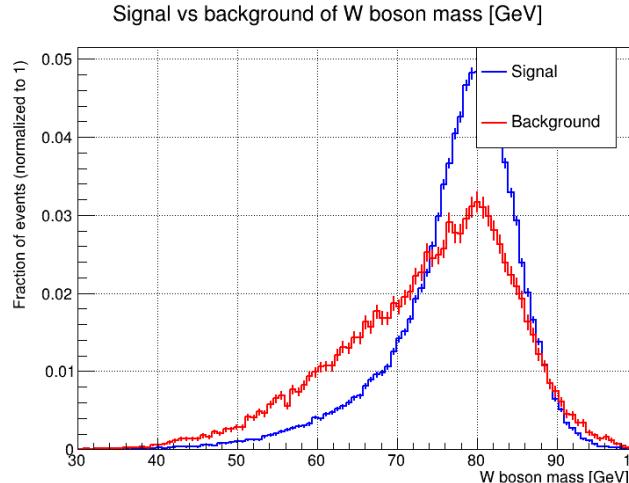

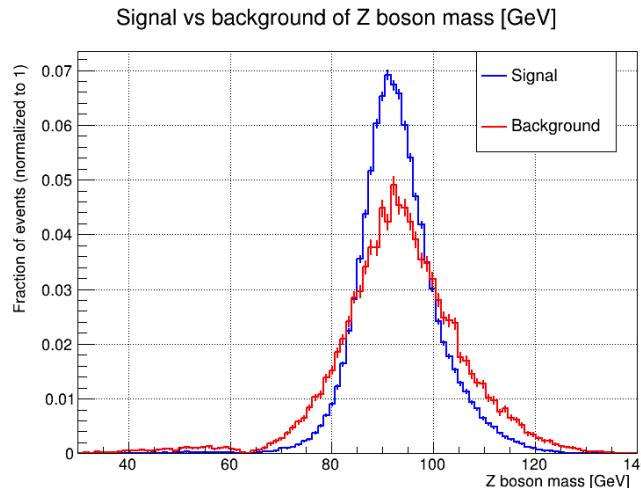

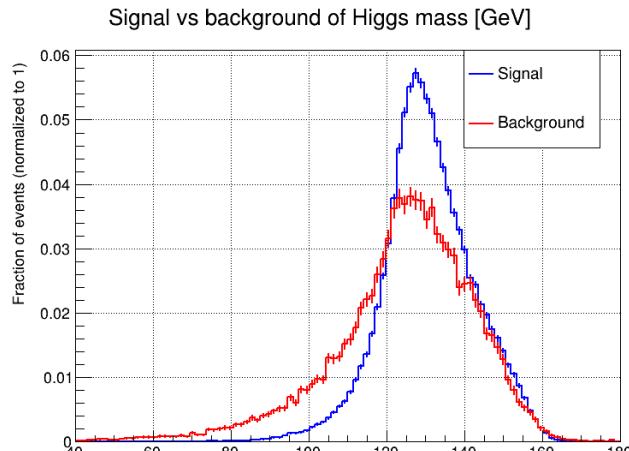

Signal vs background of  $\cos(\text{dark neutrino production angle})$

Signal vs background of  $\cos(\text{lepton helicity angle in dark neutrino rest frame})$

# BDT parameter distributions - masses

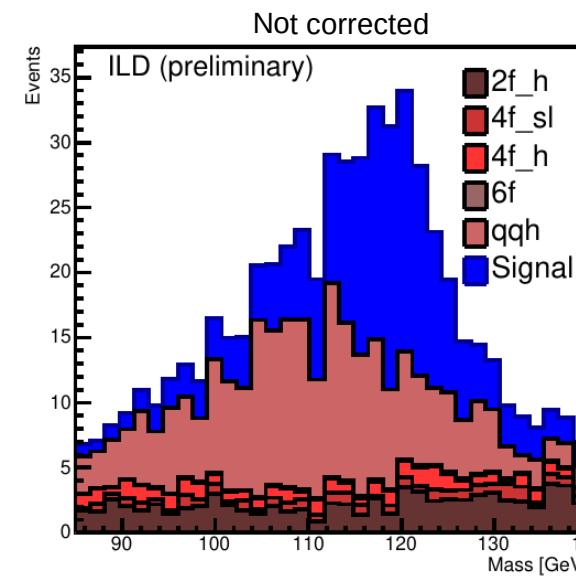

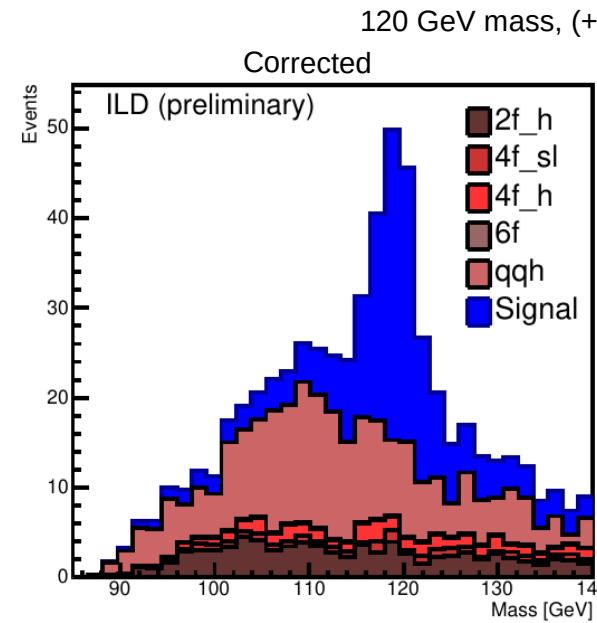

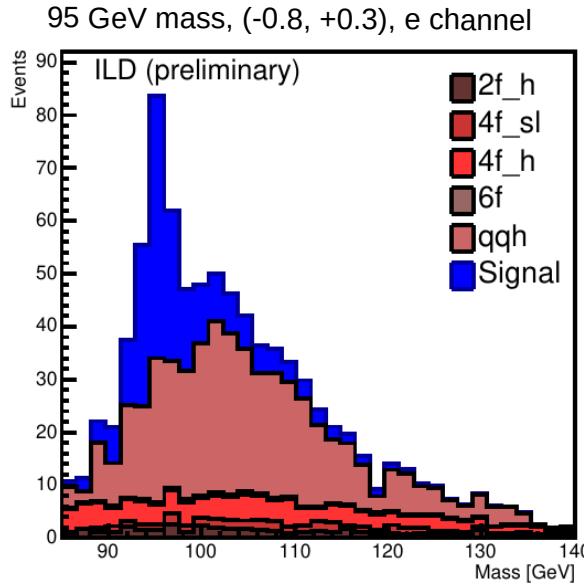

# Example cut table for dark neutrino

# Mass distributions

- Corrected mass:  $m_{ND} - m_W + m_{W_0}$
- W boson jet momentum error dominant for dark neutrino reconstruction → error removed in correction

# Mass distributions

# Potential improvements

- Lepton helicity angle in dark neutrino rest frame is incorrectly reconstructed
- Slight increase of negative angles
- Caused by error in jet clustering
  - W and Z jets are mixed
- **Improved jet clustering algorithms crucial for future collider experiments**
