Future lepton colliders landscape

Circular

(?)

Linear

- **Expensive: O(>10B)**
- **Large environmental impact**
- Power hungry
- High lumi at "low" energy
- Upgradable to hadron collider

- **Expensive: very roughly O(5B)**
- **Slightly lower environmental impact**
- A bit less power hungry
- Higher lumi at higher energies
- Extendable to higher energy

Cost (€ and environmental) driven by length, not operation

How to reduce the cost?

"Simply" decrease the size of the tunnel...

- But **shorter tunnel = lower beam energy** => physicists 😭

How to reduce the cost?

"Simply" decrease the size of the tunnel...

- But **shorter tunnel = lower beam energy** => physicists 😭
- Except if you can get higher gradients!
 - RF: ~30 MV/m (ILC)
 - **Plasma wake field acceleration** (PWFA) cavities ~ expected O(1000 MV/m) — ie x30!

How to reduce the cost?

"Simply" decrease the size of the tunnel...

- But **shorter tunnel = lower beam energy** => physicists 😭
- Except if you can get higher gradients!
 - RF: ~30 MV/m (ILC)
 - **Plasma wake field acceleration** (PWFA) cavities ~ expected O(1000 MV/m) — ie x30!
- **PWFA** not yet available: **requires ~10 years of development...**
 - ... but is relevant given current timescales for future accelerators.
 - **Only for electron acceleration.**

How to reduce the cost?

"Simply" decrease the size of the tunnel...

- But **shorter tunnel = lower beam energy** => physicists 😭
- Except if you can get higher gradients!
 - RF: ~30 MV/m (ILC)
 - **Plasma wake field acceleration** (PWFA) cavities ~ expected O(1000 MV/m) — ie x30!
- **PWFA** not yet available: **requires ~10 years of development...**
 - ... but is relevant given current timescales for future accelerators.
 - **Only for electron acceleration.**
- => **Size of the facility could be reduced by a factor ~2** (on the electron side):
 - ILC(250 GeV): 10 km (e⁻, SRF) + 10 km (e⁺, SRF)
 - Hybrid: <1 km (e⁻, PWFA) + 10 km (e⁺, SRF)

How to reduce the cost?

"Simply" decrease the size of the tunnel...

- But **shorter tunnel = lower beam energy** => physicists 😭
- Except if you can get higher gradients!
 - RF: ~30 MV/m (ILC)
 - **Plasma wake field acceleration** (PWFA) cavities ~ expected O(1000 MV/m) — ie x30!
- **PWFA** not yet available: **requires ~10 years of development...**
 - ... but is relevant given current timescales for future accelerators.
 - **Only for electron acceleration.**
- => **Size of the facility could be reduced by a factor ~2** (on the electron side):
 - ILC(250 GeV): 10 km (e⁻, SRF) + 10 km (e⁺, SRF)
 - Hybrid: <1 km (e⁻, PWFA) + 10 km (e⁺, SRF)
- **Can we do better than 1 km + 10 km?**

The HALHF concept

- H**ybrid : mix of plasma (e^-) and SRF (e^+) acceleration
- A**symmetric : **500 GeV e^- & 31.3 GeV e^+** (also gives $\sqrt{s} = 250$ GeV)
- L**inear : (not circular)
- H**iggs : (but could go up to $t\bar{t}$ threshold)
- F**actory

*Length = ~ 3.3 km: similar to XFEL@DESY
 Cost = ~ 2.1 B€ +/- 25% = \sim ILC/4 = \sim EIC*

*Length dominated by e^- BDS
 Cost still dominated by tunnel and RF linac*

Disclaimer

- I am **not** an accelerator physicist, not a specialist of PWFA.
- Assumptions for the rest of this talk:
 - Electron-beam driven PWFA is proven **working for electron acceleration** in ~10-15 years.
 - We can build a collision-quality beam in ~5 more years.
 - PWFA for **positron is still not available**.
- These might be strong assumptions, but we need a **starting point** to think about a detector!
 - => In the following I focus on the physics and detector side, not accelerator side.

Now the questions arise

- Asymmetric beam energies => boosted topologies ($\gamma \sim 2.1$)
 - **Can we still do physics in such conditions?**
 - Not scary for anyone who worked at HERA ($\gamma = 3$)...
 - ... Yet, it's not quite the same physics 😞
- **Study cases:**
 - **Higgs mass** measurement.
 - **Forward/backward asymmetry** measurement.
- Other question: how does it impact the energy efficiency?
- Not studied here:
 - Boost most likely improves jet flavour-tagging.
 - Luminosity measurement is probably not as straightforward.

Impact on physics: Higgs

- Process: $e^+e^- \rightarrow Z(\mu^+\mu^-)H$
- Measure Higgs mass via recoil mass.
- Detector: ILD with fast simulation (SGV), including correct tracking.

- **Resolution loss due muons being boosted forward:**

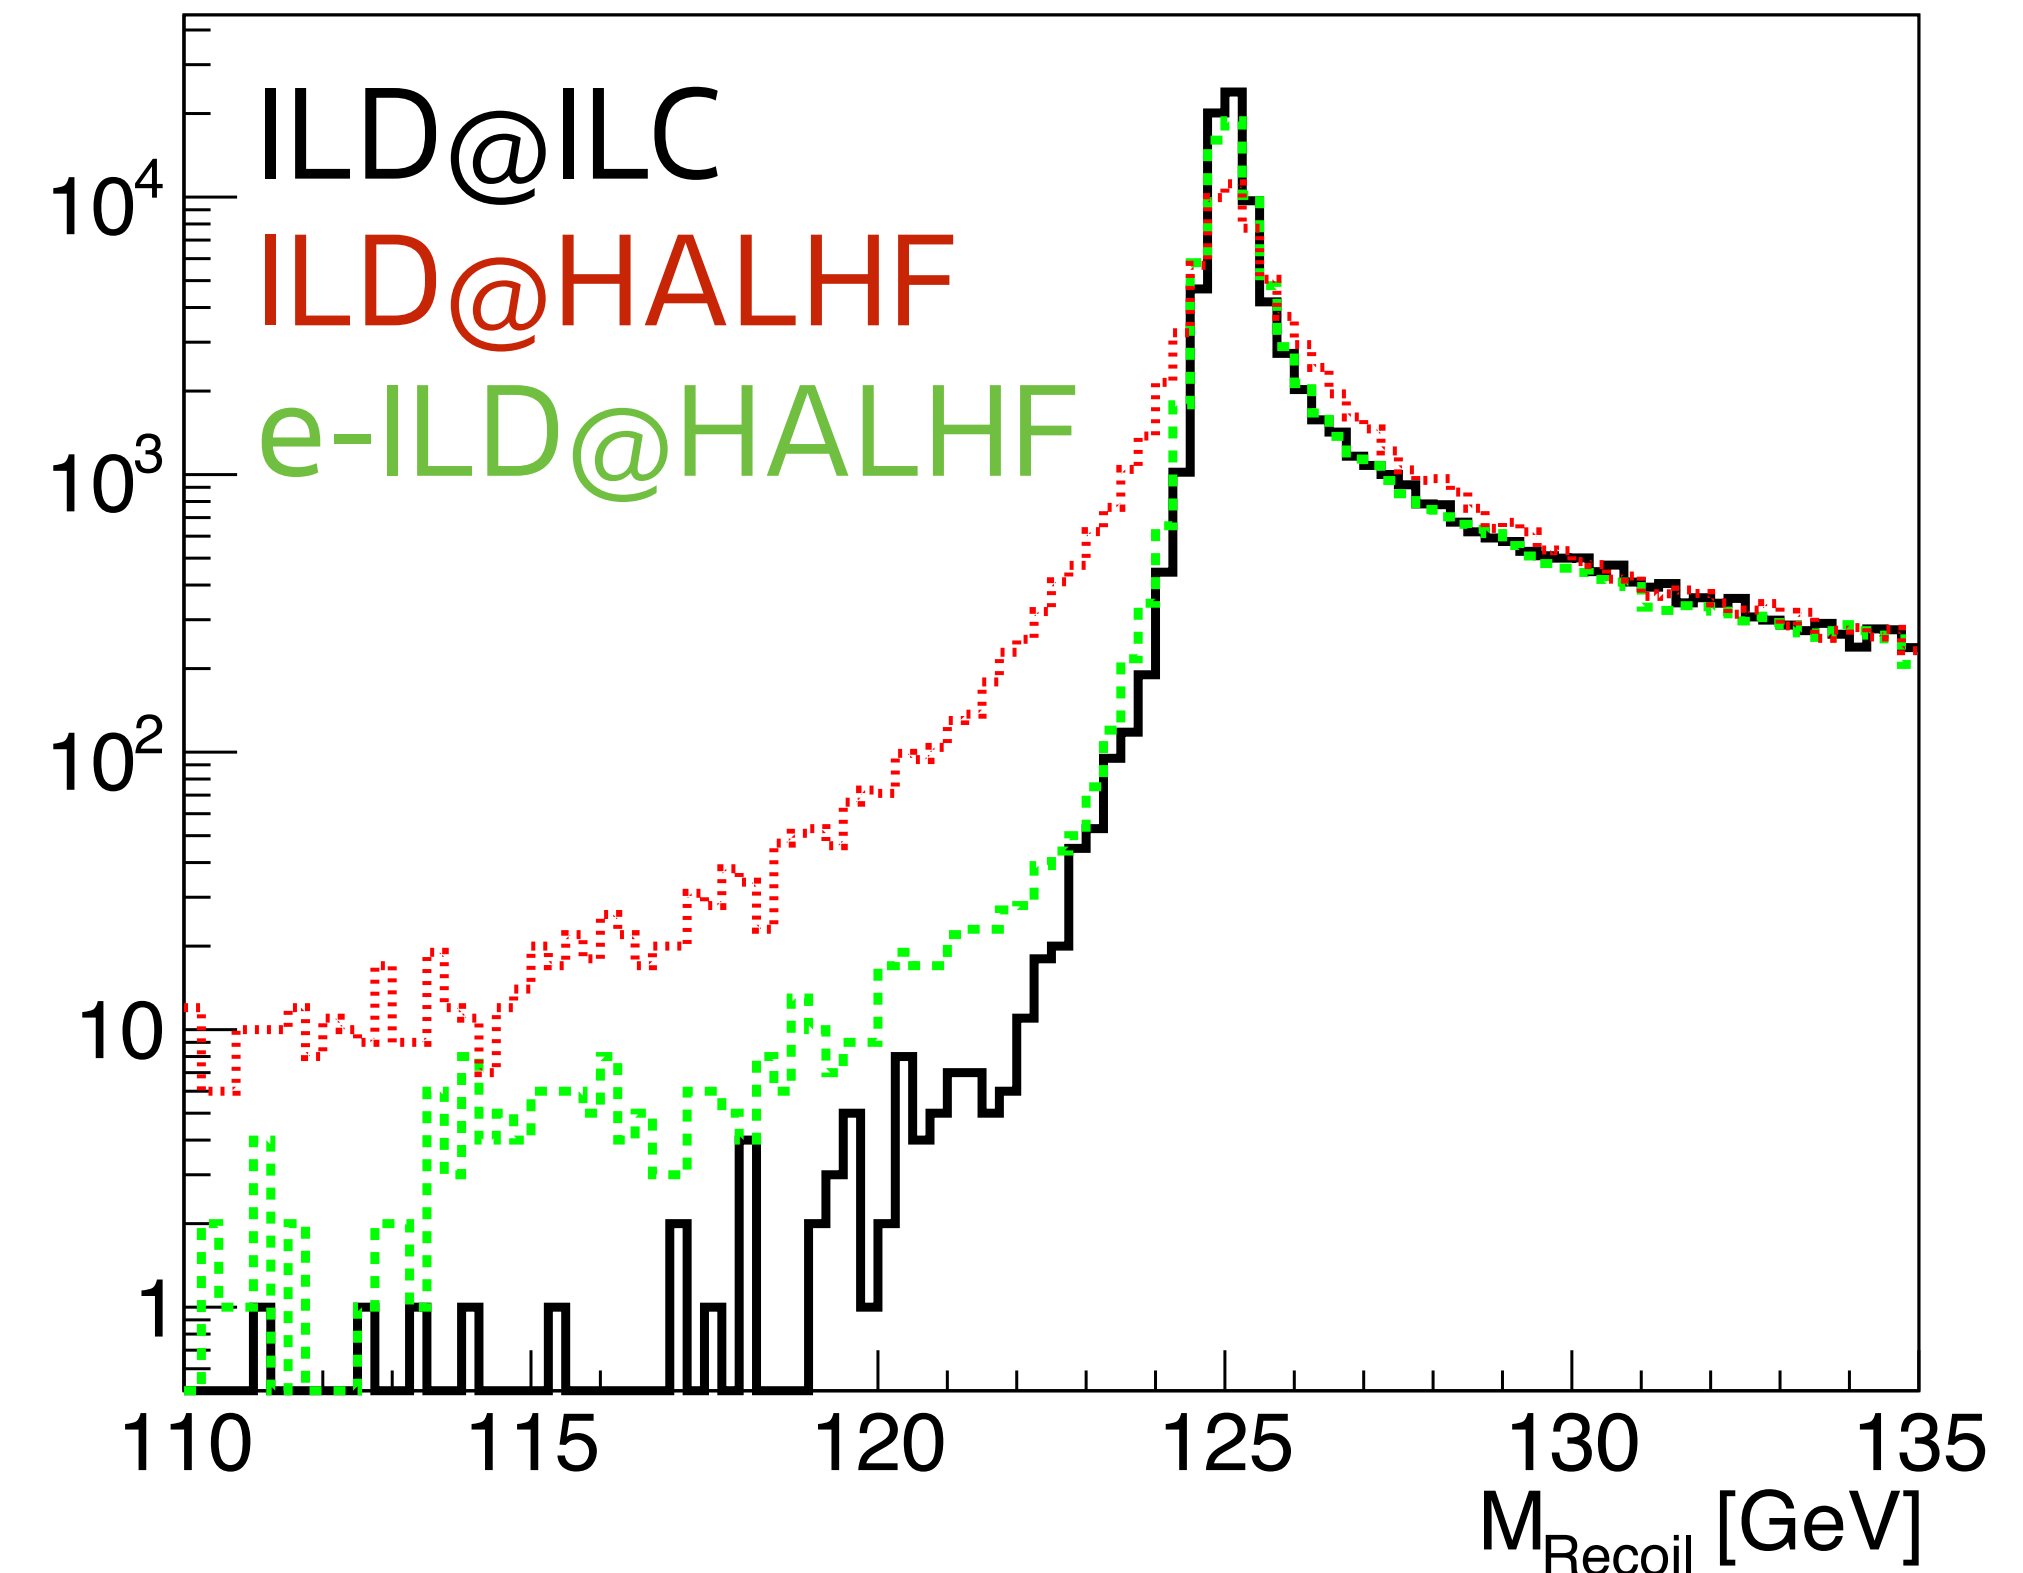

- less lever arm => lower muon momentum resolution.
- $\sigma_{\text{ILD@HALHF}} = 2.2 \times \sigma_{\text{ILD@ILC}}$

Impact on physics: Higgs

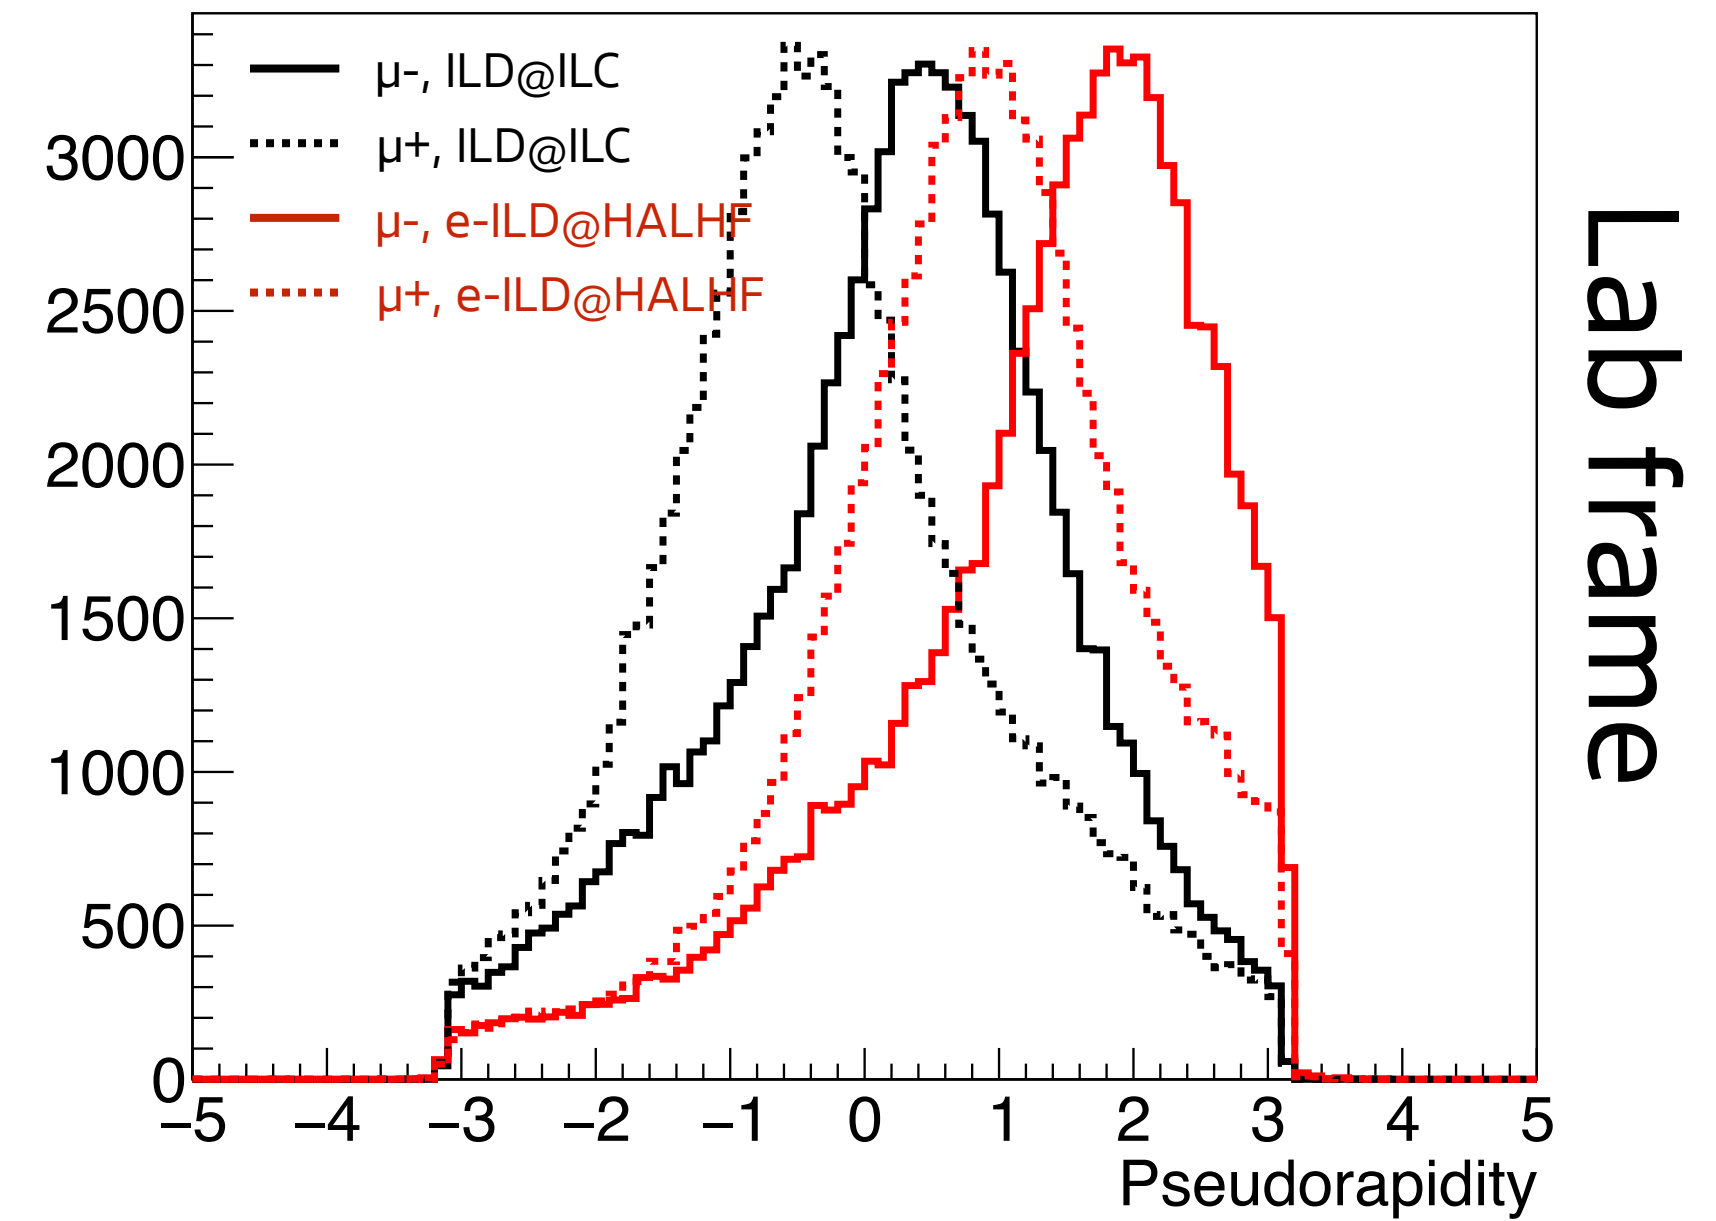

- Process: $e^+e^- \rightarrow Z(\mu^+\mu^-)H$
- Measure Higgs mass via recoil mass.
- Detector: ILD with fast simulation (SGV), including correct tracking.
- **Resolution loss due muons being boosted forward:**
 - less lever arm => lower muon momentum resolution.
 - $\sigma_{\text{ILD@HALHF}} = 2.2 \times \sigma_{\text{ILD@ILC}}$
- Mitigation: **extend the barrel in the forward region!**
 - $\sigma_{\text{e-ILD@HALHF}} = 1.2 \times \sigma_{\text{ILD@ILC}}$
 - => loss of only 20% on recoil mass.

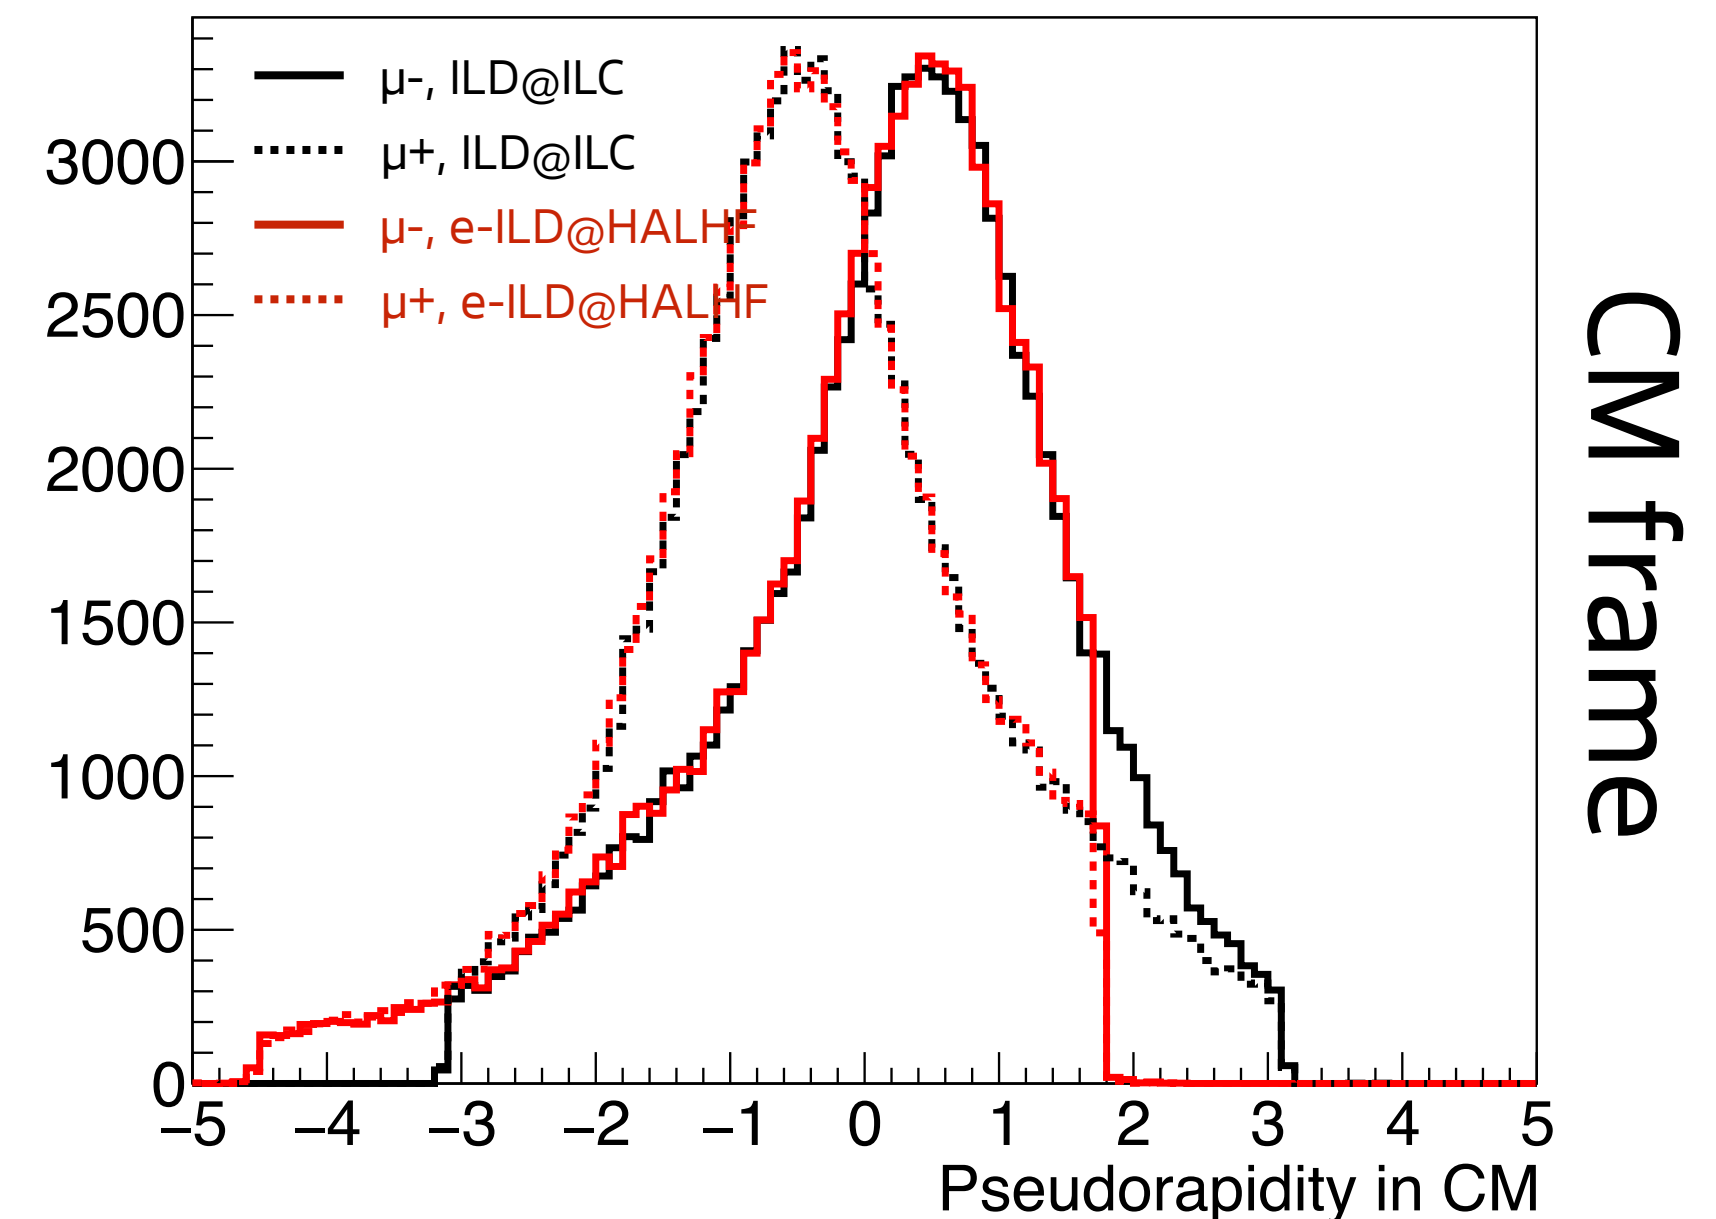

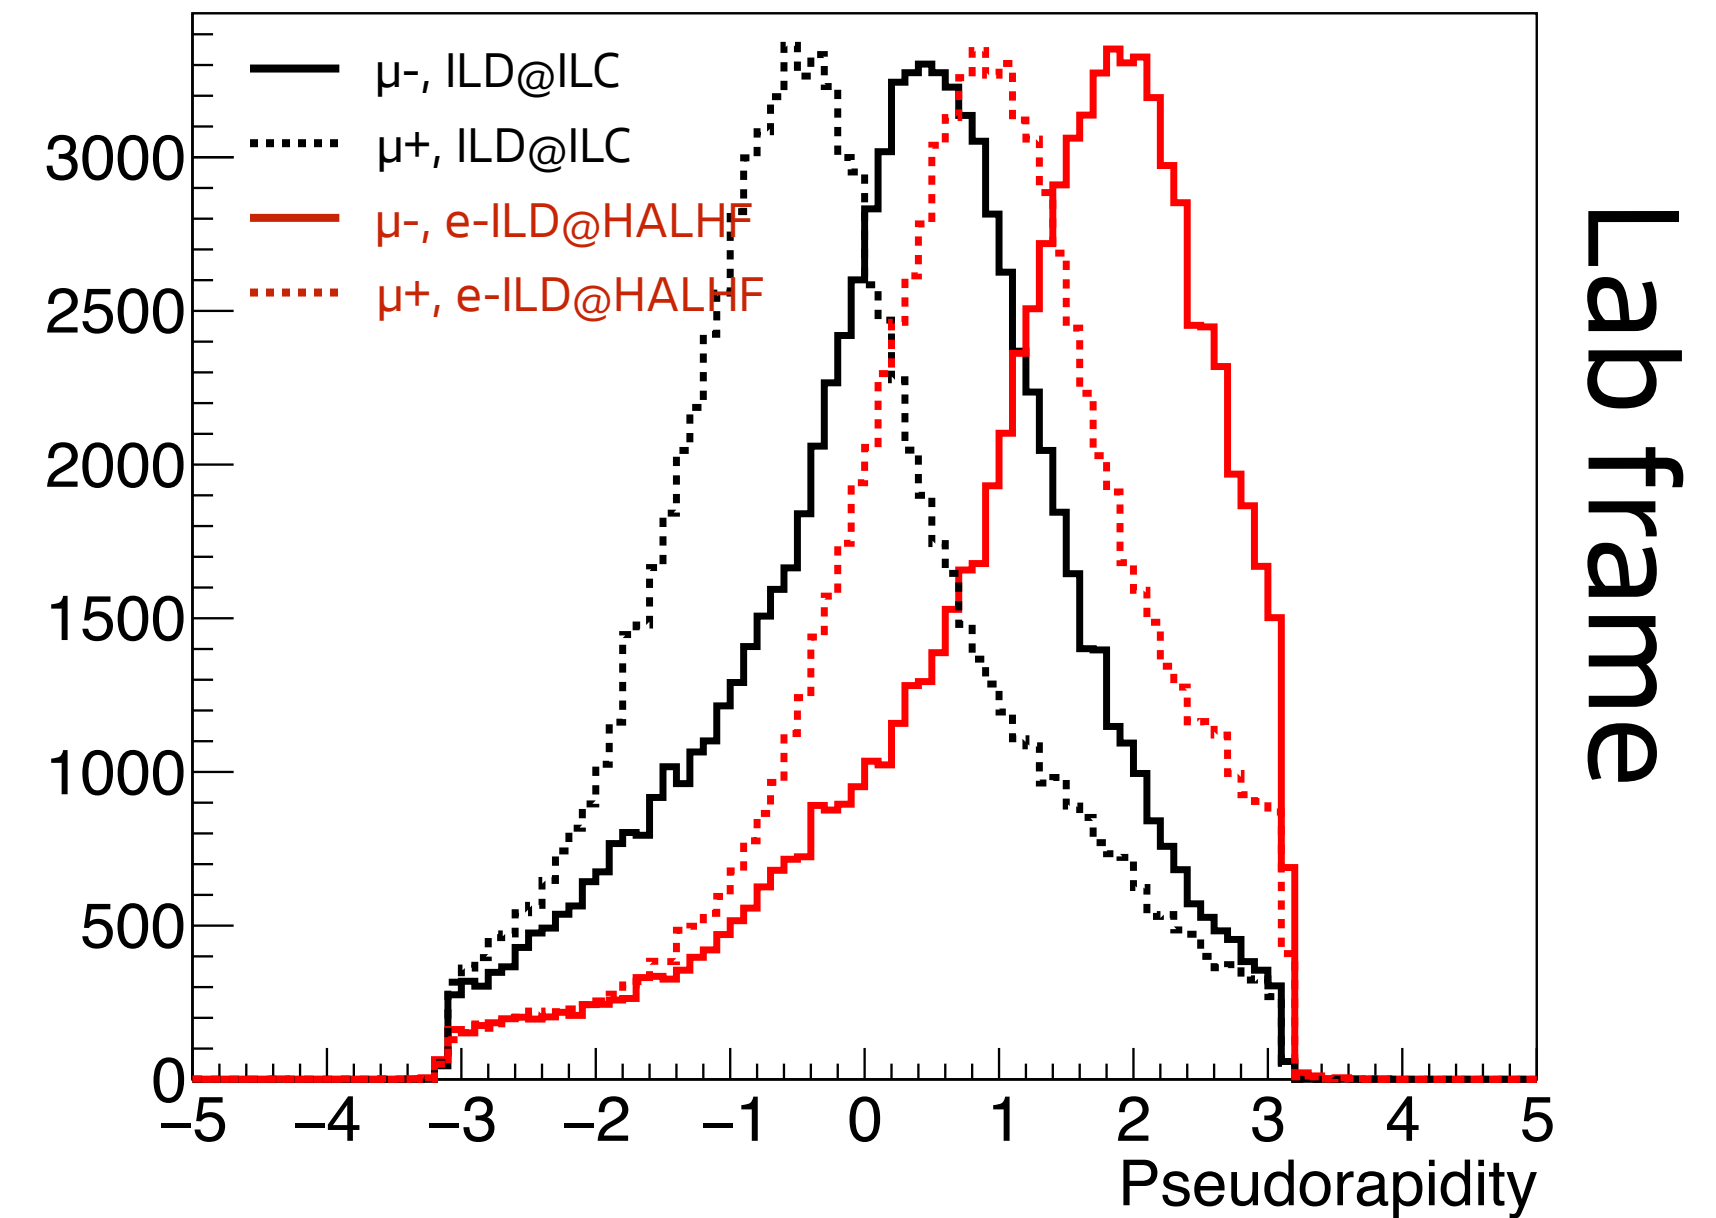

Impact on physics: F/B asymmetry

- Process: $e^+e^- \rightarrow \mu^+\mu^-$
 - [black] ILD@ILC
 - [red] extended ILD @ HALHF

Impact on physics: F/B asymmetry

- Process: $e^+e^- \rightarrow \mu^+\mu^-$
 - **ILD@ILC**
 - **extended ILD @ HALHF**
- Move to the CM frame to ease the comparison:
 - Core of distribution is the same (as expected)
 - => in particular: same width
 - **Tail extends on one side and is cut on the other.**
- Lose on one side, but gain on the other.
- => **Need more studies, especially for systematic uncertainties** (since setup itself is asymmetric).

Power efficiency

The asymmetry strikes back

- **Asymmetric energy => loss of "energy efficiency"** compared to symmetric case (some energy goes in the boost)

- $$\frac{P}{P_{\text{sym}}} = \frac{E_- N_- + E_+ N_+}{\sqrt{N_- N_+} \sqrt{s}}$$

- With:

- $E_- = 500 \text{ GeV}$ and $E_+ = 31 \text{ GeV}$,
- $N_- : N_+ = 2 : 2 \times 10^{10}$ particles / bunch, } $P/P_{\text{sym}} = 2.13$ (= boost factor)

Power efficiency

The asymmetry strikes back

- **Asymmetric energy => loss of "energy efficiency"** compared to symmetric case (some energy goes in the boost)

- $$\frac{P}{P_{\text{sym}}} = \frac{E_- N_- + E_+ N_+}{\sqrt{N_- N_+} \sqrt{s}}$$

- With:

- $E_- = 500 \text{ GeV}$ and $E_+ = 31 \text{ GeV}$,
 - $N_- : N_+ = 2 : 2 \times 10^{10}$ particles / bunch, } $P/P_{\text{sym}} = 2.13$ (= boost factor)

- But what matters is **luminosity** $\mathcal{L} \propto N_- \times N_+ \Rightarrow$ **same \mathcal{L} while being more energy-efficient** by:
 - decreasing the bunch charge of the high-energy beam (e-)
 - and increasing the bunch charge of the low-energy beam (e+).

Power efficiency

The asymmetry strikes back

- **Asymmetric energy => loss of "energy efficiency"** compared to symmetric case (some energy goes in the boost)

- $$\frac{P}{P_{\text{sym}}} = \frac{E_- N_- + E_+ N_+}{\sqrt{N_- N_+} \sqrt{s}}$$

- With:

- $E_- = 500 \text{ GeV}$ and $E_+ = 31 \text{ GeV}$,
 - $N_- : N_+ = 2 : 2 \times 10^{10}$ particles / bunch, } $P/P_{\text{sym}} = 2.13$ (= boost factor)

- But what matters is **luminosity** $\mathcal{L} \propto N_- \times N_+ \Rightarrow$ **same \mathcal{L} while being more energy-efficient** by:

- decreasing the bunch charge of the high-energy beam (e-)
 - and increasing the bunch charge of the low-energy beam (e+).

- Ideally by the opposite factor as energy asymmetry.

- **Limited by beam-induced background** (see next slides):

- $N_- : N_+ = 1.33 : 3 \times 10^{10}$ particles / bunch $\Rightarrow P/P_{\text{sym}} = 1.5$

Beam-strahlung

Creation of many e^+e^- pairs...

e^- beam
high E, lower N

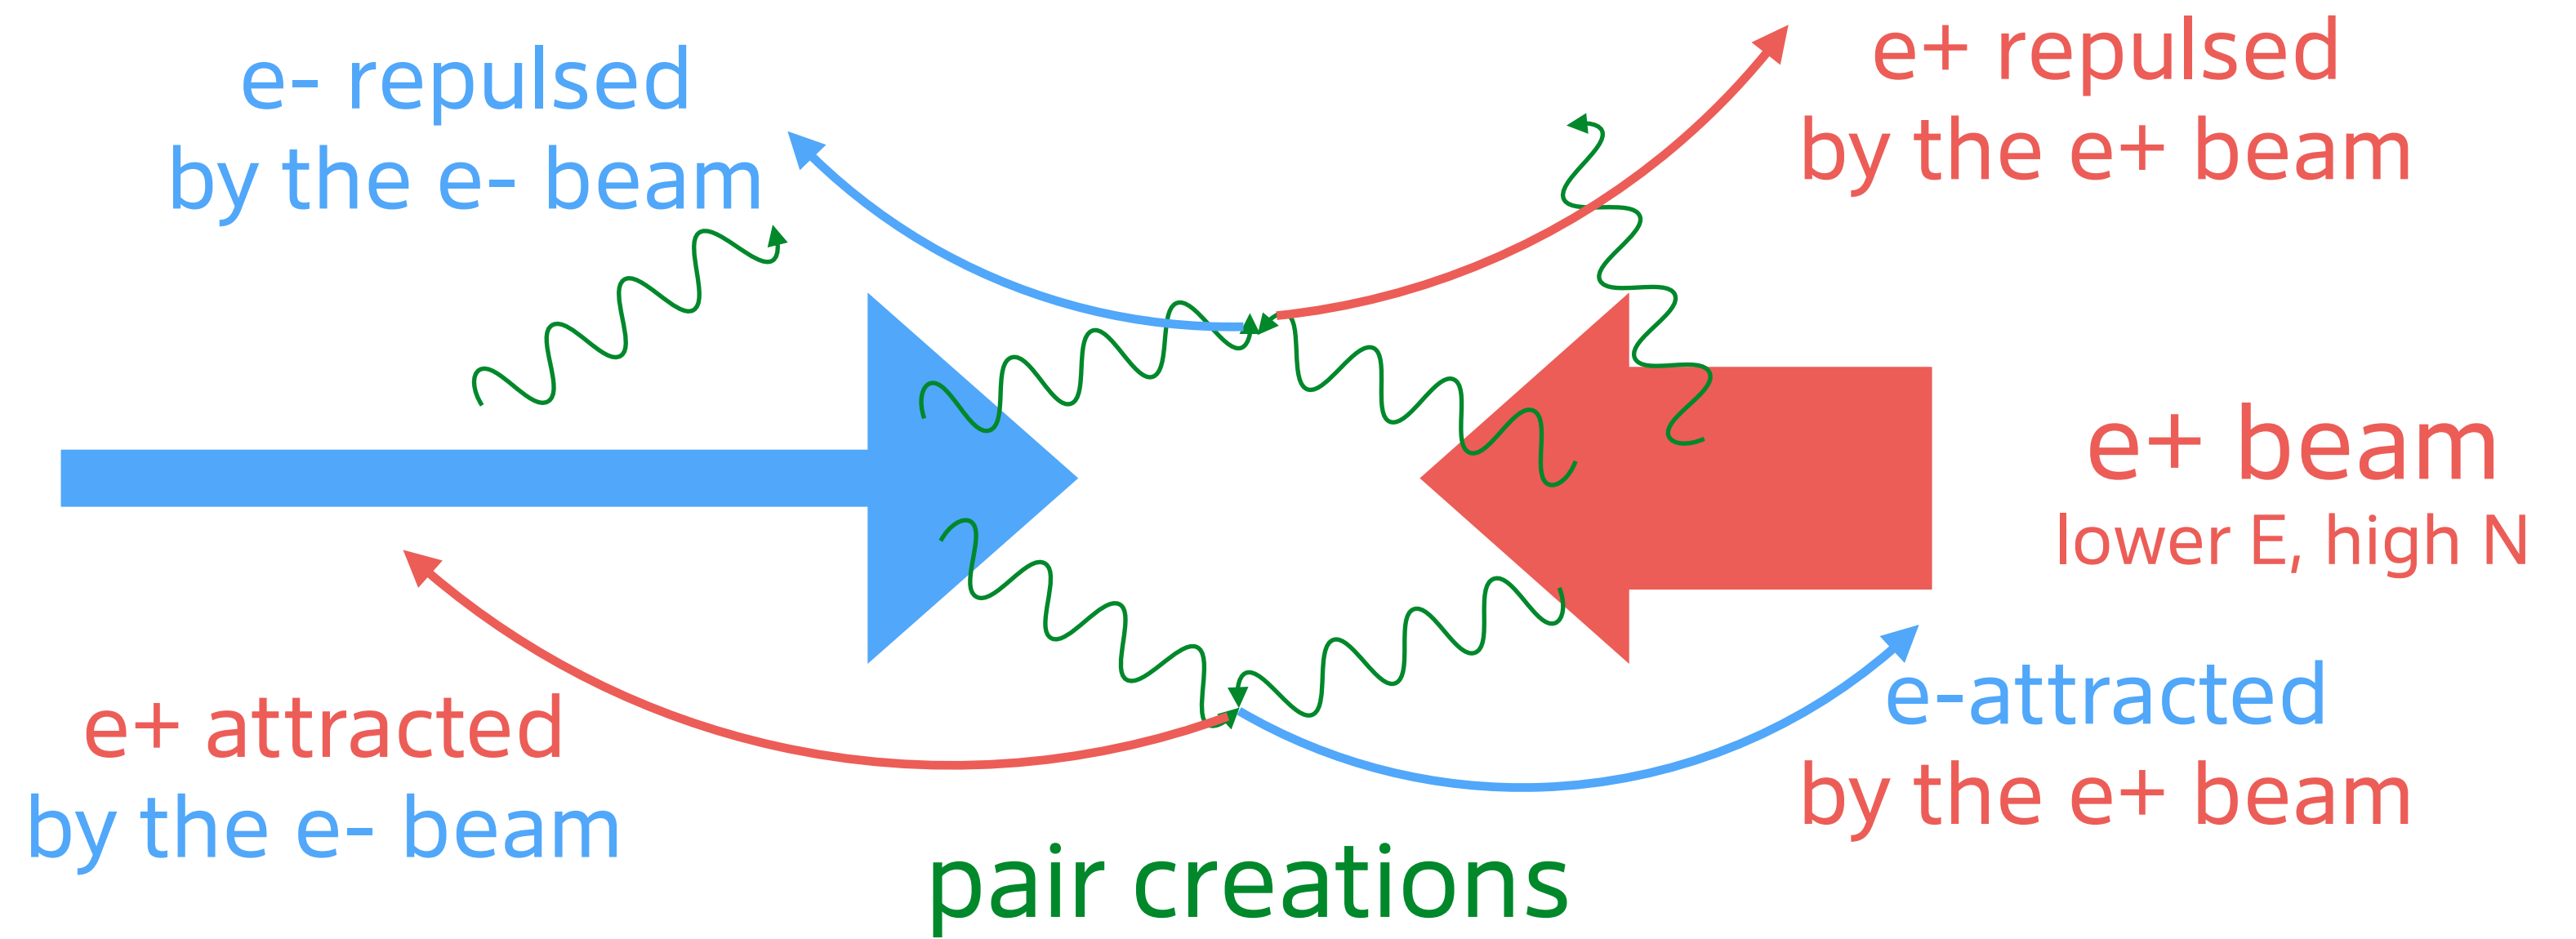

e^+ beam
lower E, high N

Beam-strahlung

Creation of many e^+e^- pairs...

e^- beam
high E, lower N

Beam-strahlung

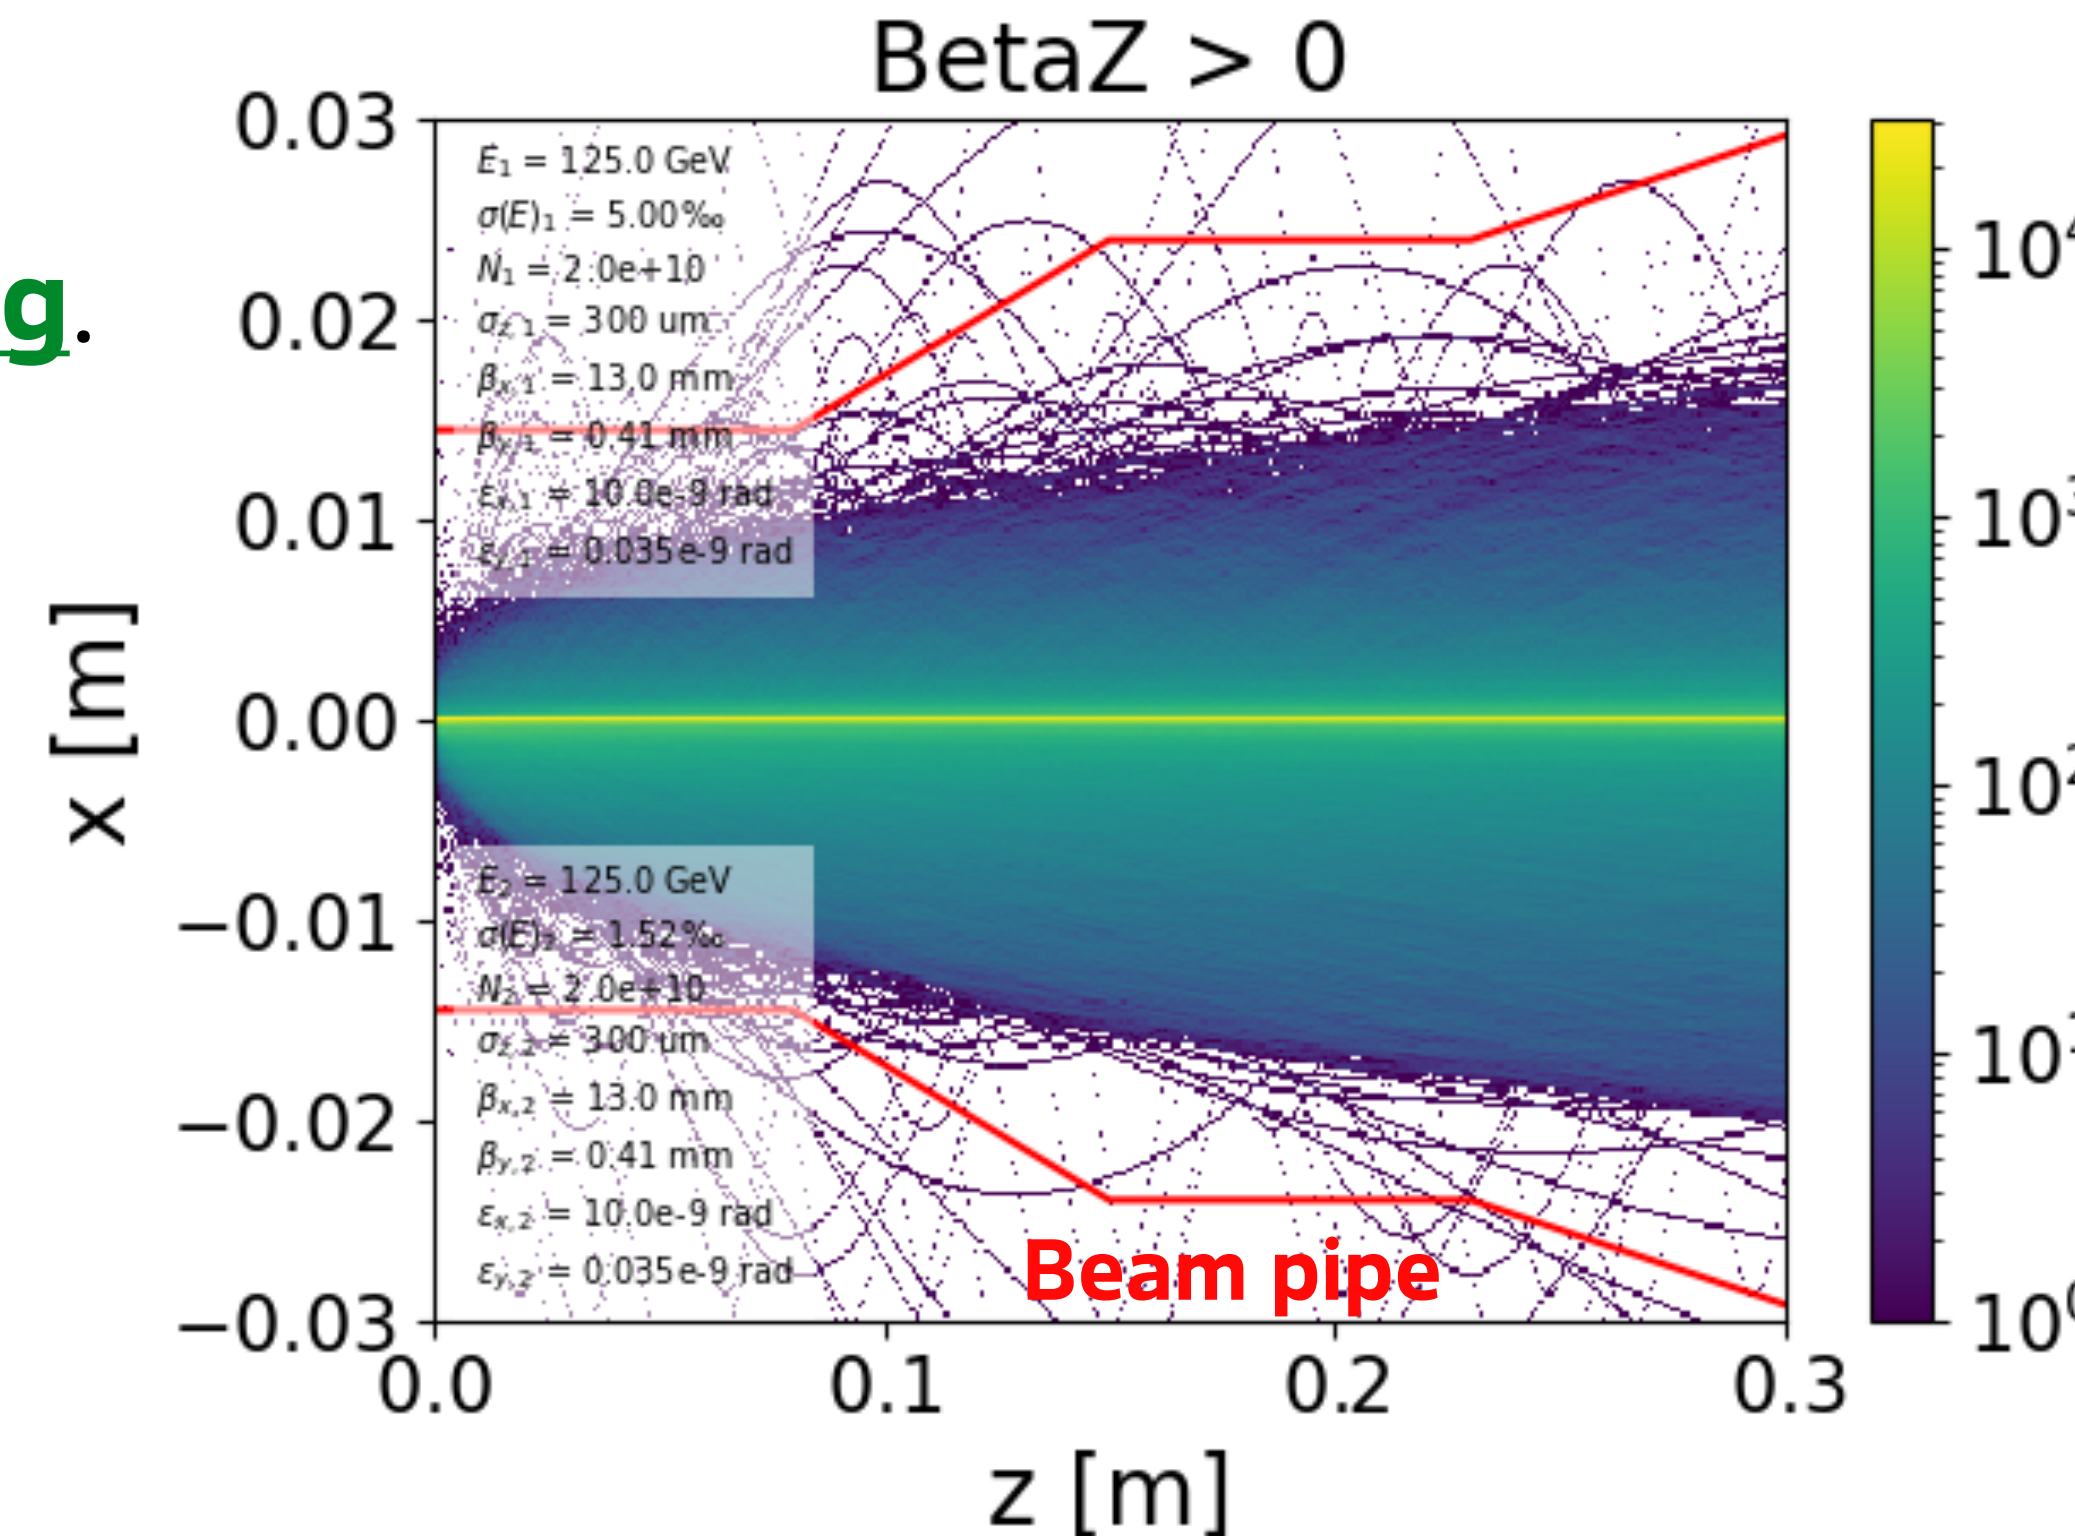

Creation of many e⁺e⁻ pairs...

e⁻ beam
high E, lower N

- **Simulate the beam-beam interaction using Guinea-Pig.**

- Example: plot the trajectories of all pairs created in the forward direction.
- Here in the ILC configuration (symmetric beams)

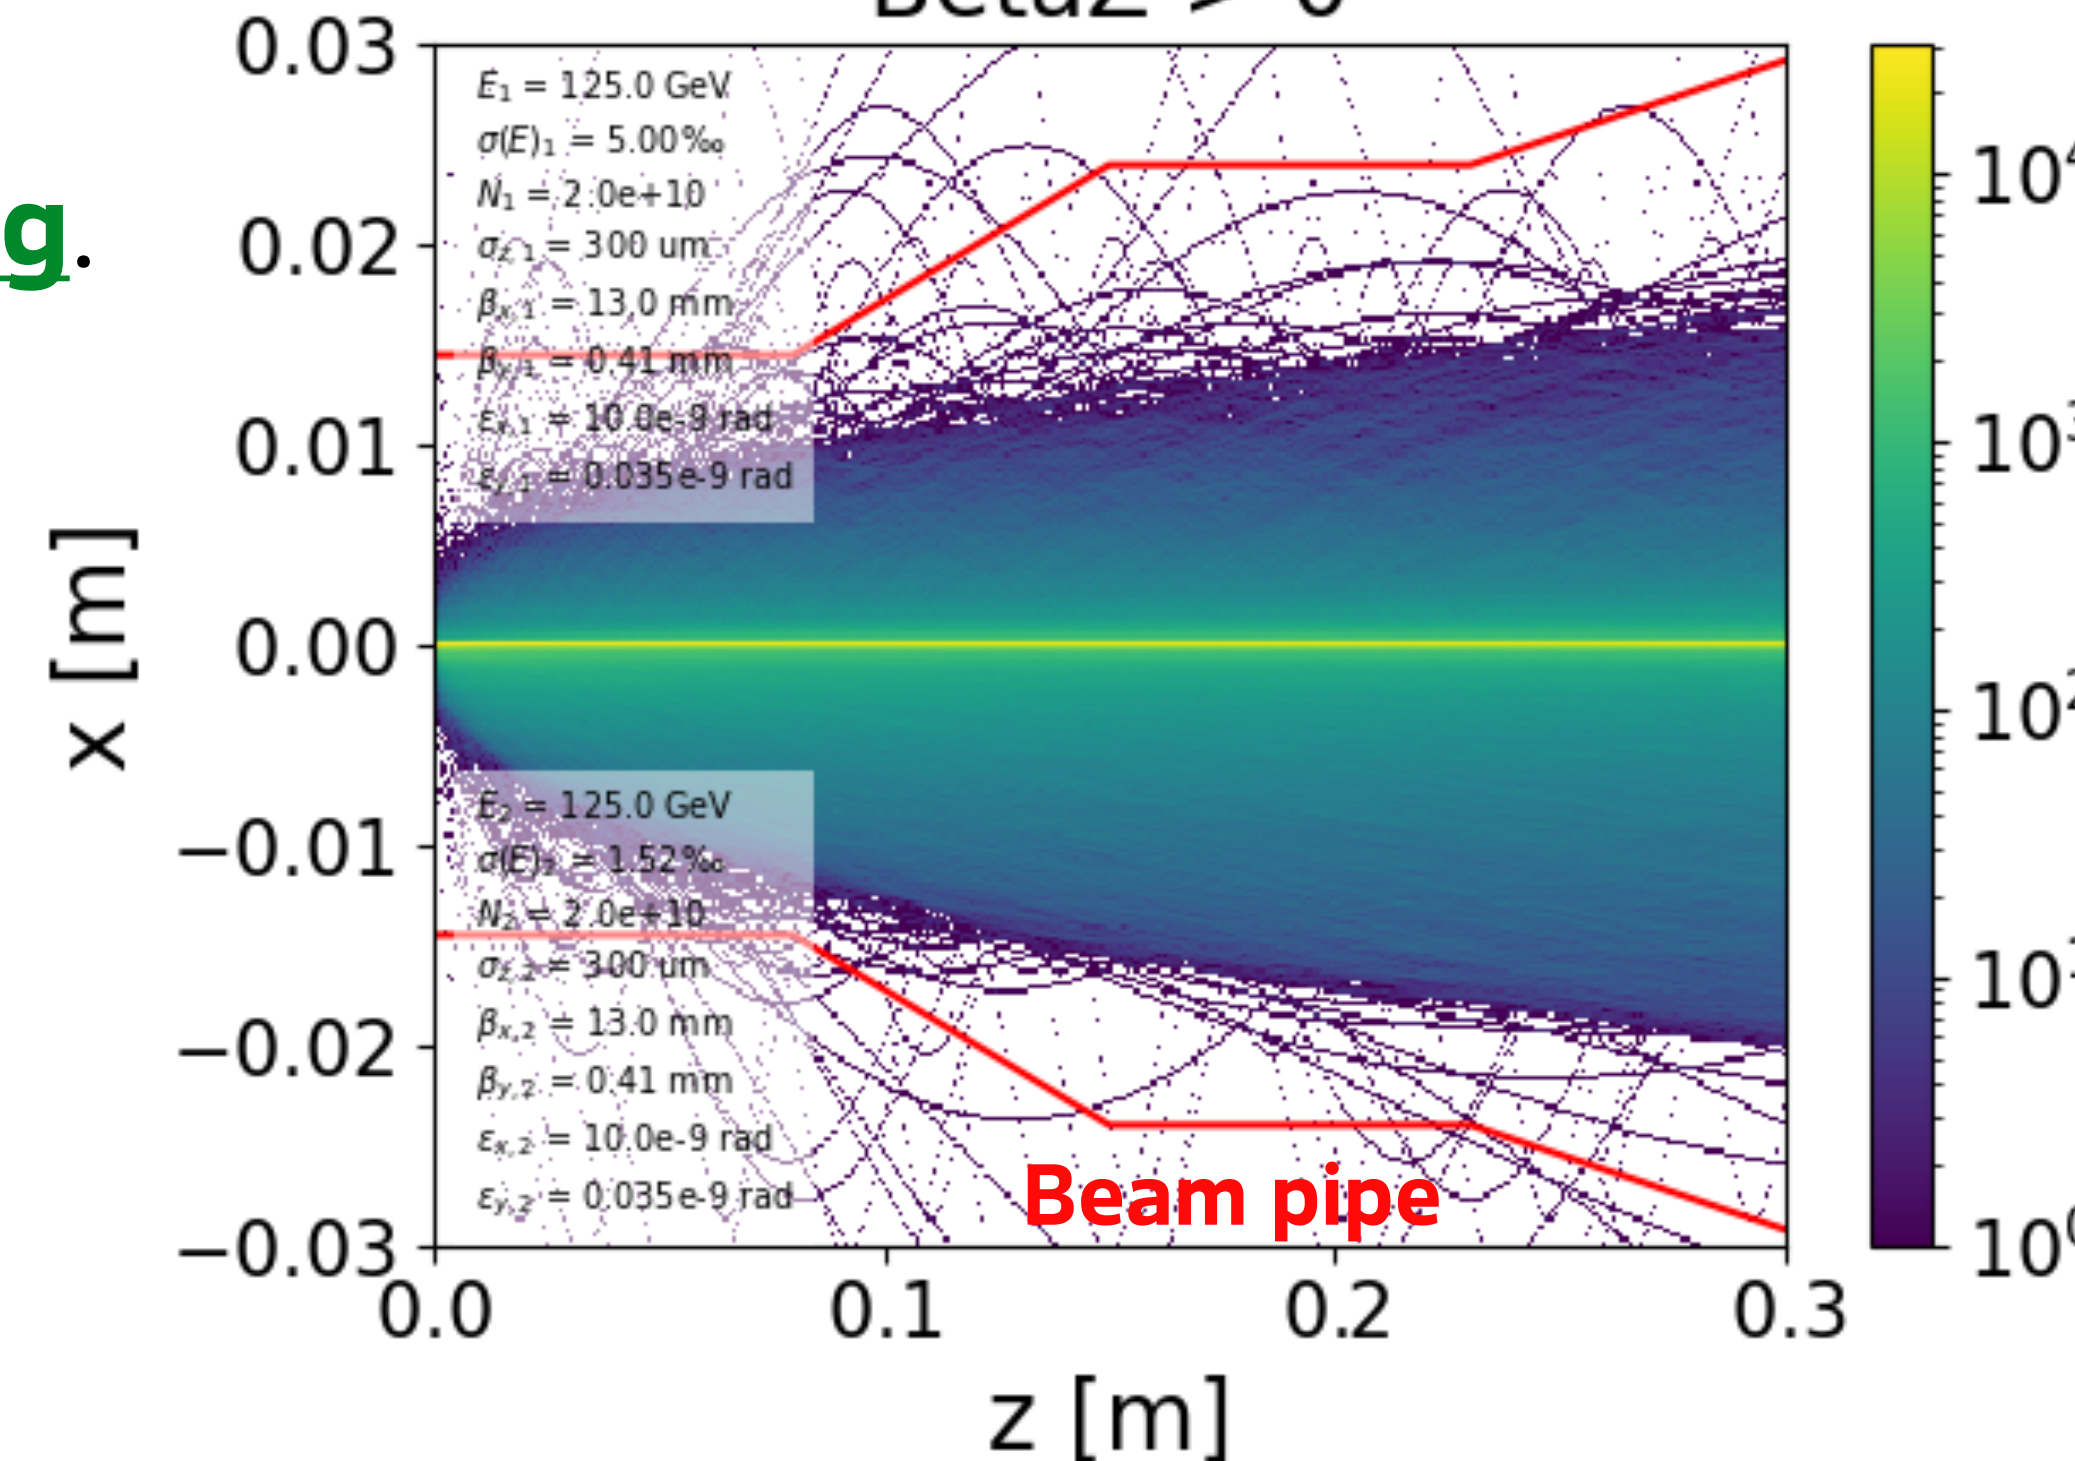

Beam-strahlung

Creation of many e^+e^- pairs...

e^- beam
high E, lower N

BetaZ > 0

Simulate the beam-beam interaction using Guinea-Pig.

- Example: plot the trajectories of all pairs created in the forward direction.
- Here in the ILC configuration (symmetric beams)

This is ~ independent of beam energy, but rather depends on the beam charge.

Beam-strahlung

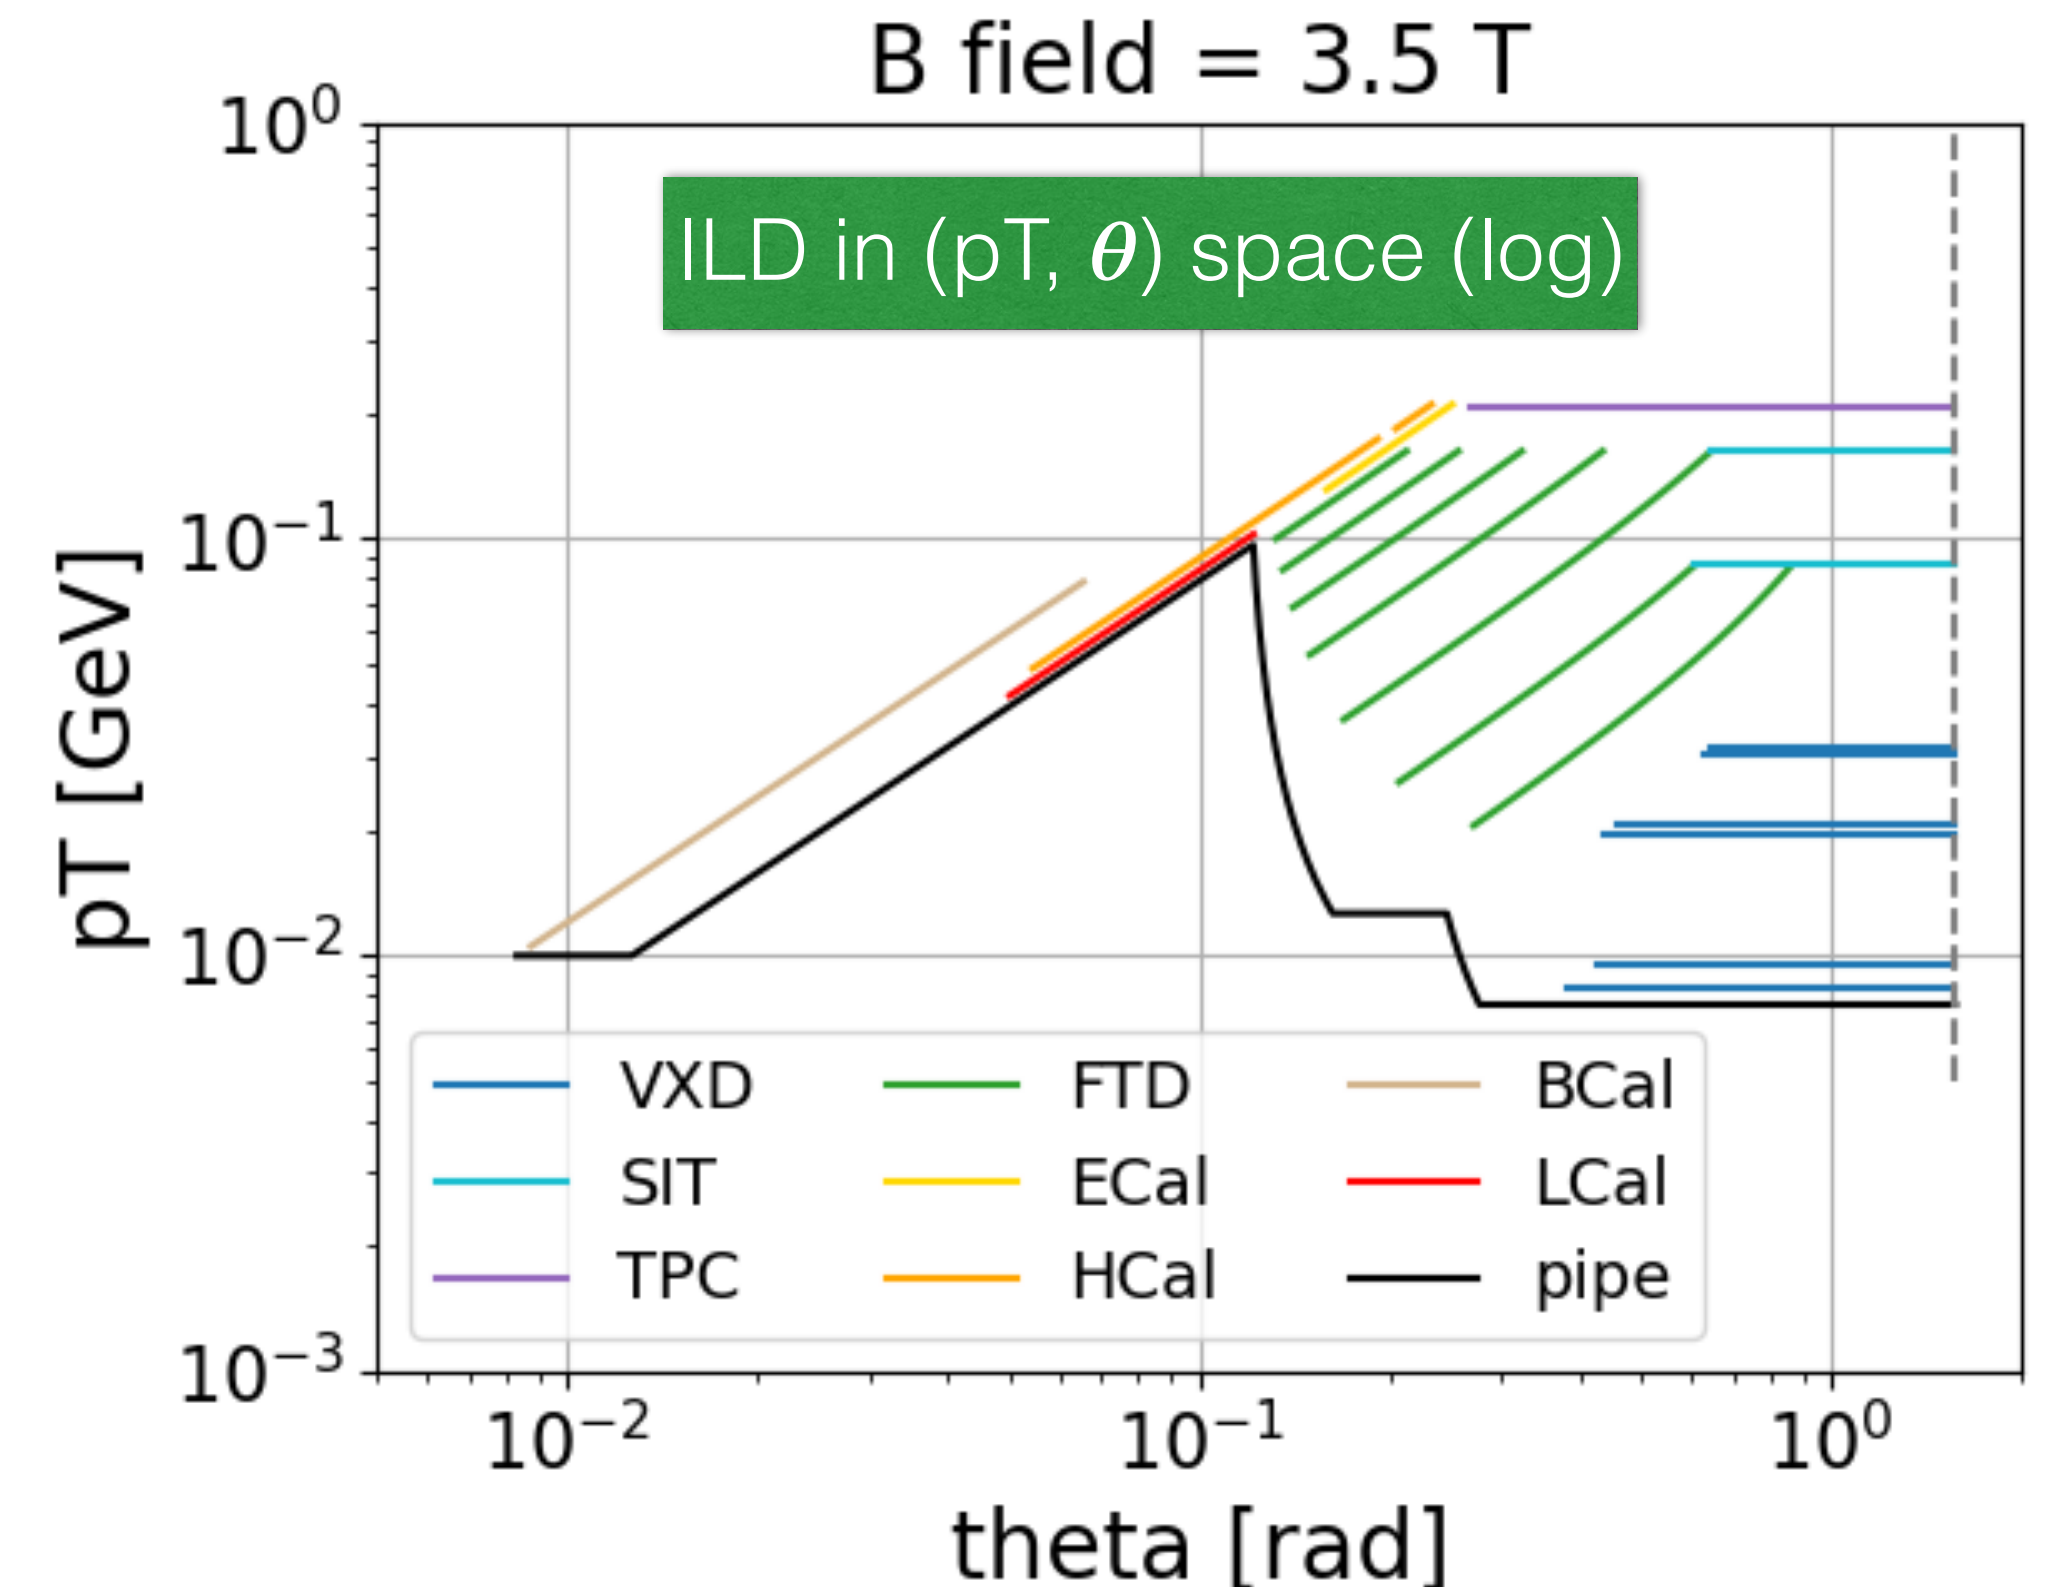

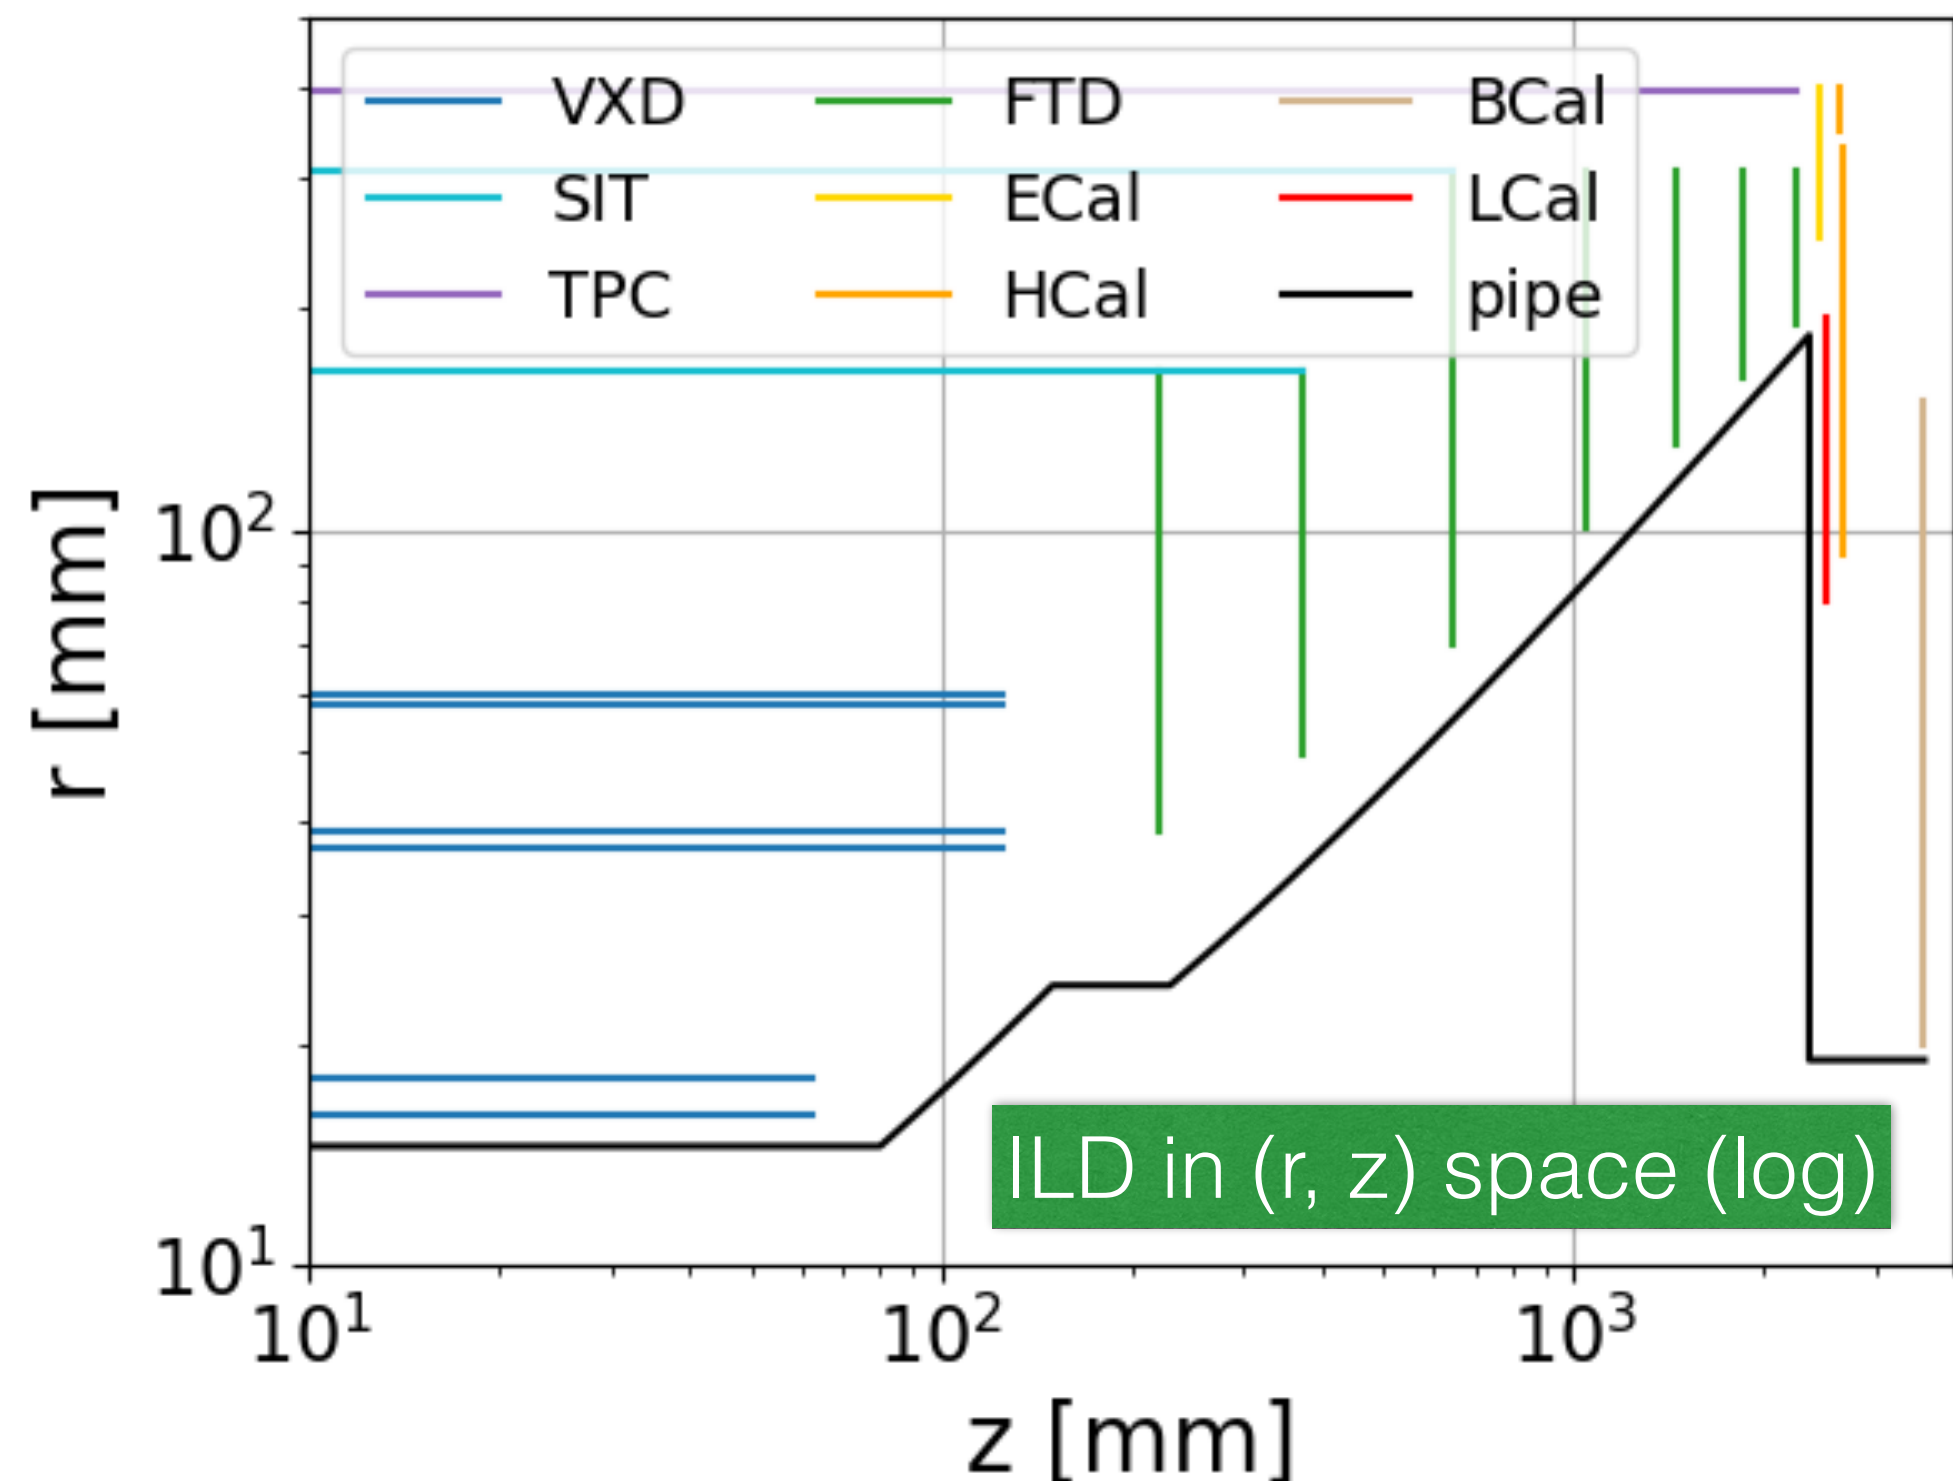

Drawing the detector like you've never seen it!

- Usual representation of this effect:
 - Let a e^-/e^+ with given (p_T, θ) . This fully defines its trajectory (helix), for a given B field.
 - **If/Where does this helix hit the detector?** \Rightarrow "Hit map" in the (p_T, θ) space.

Beam-strahlung

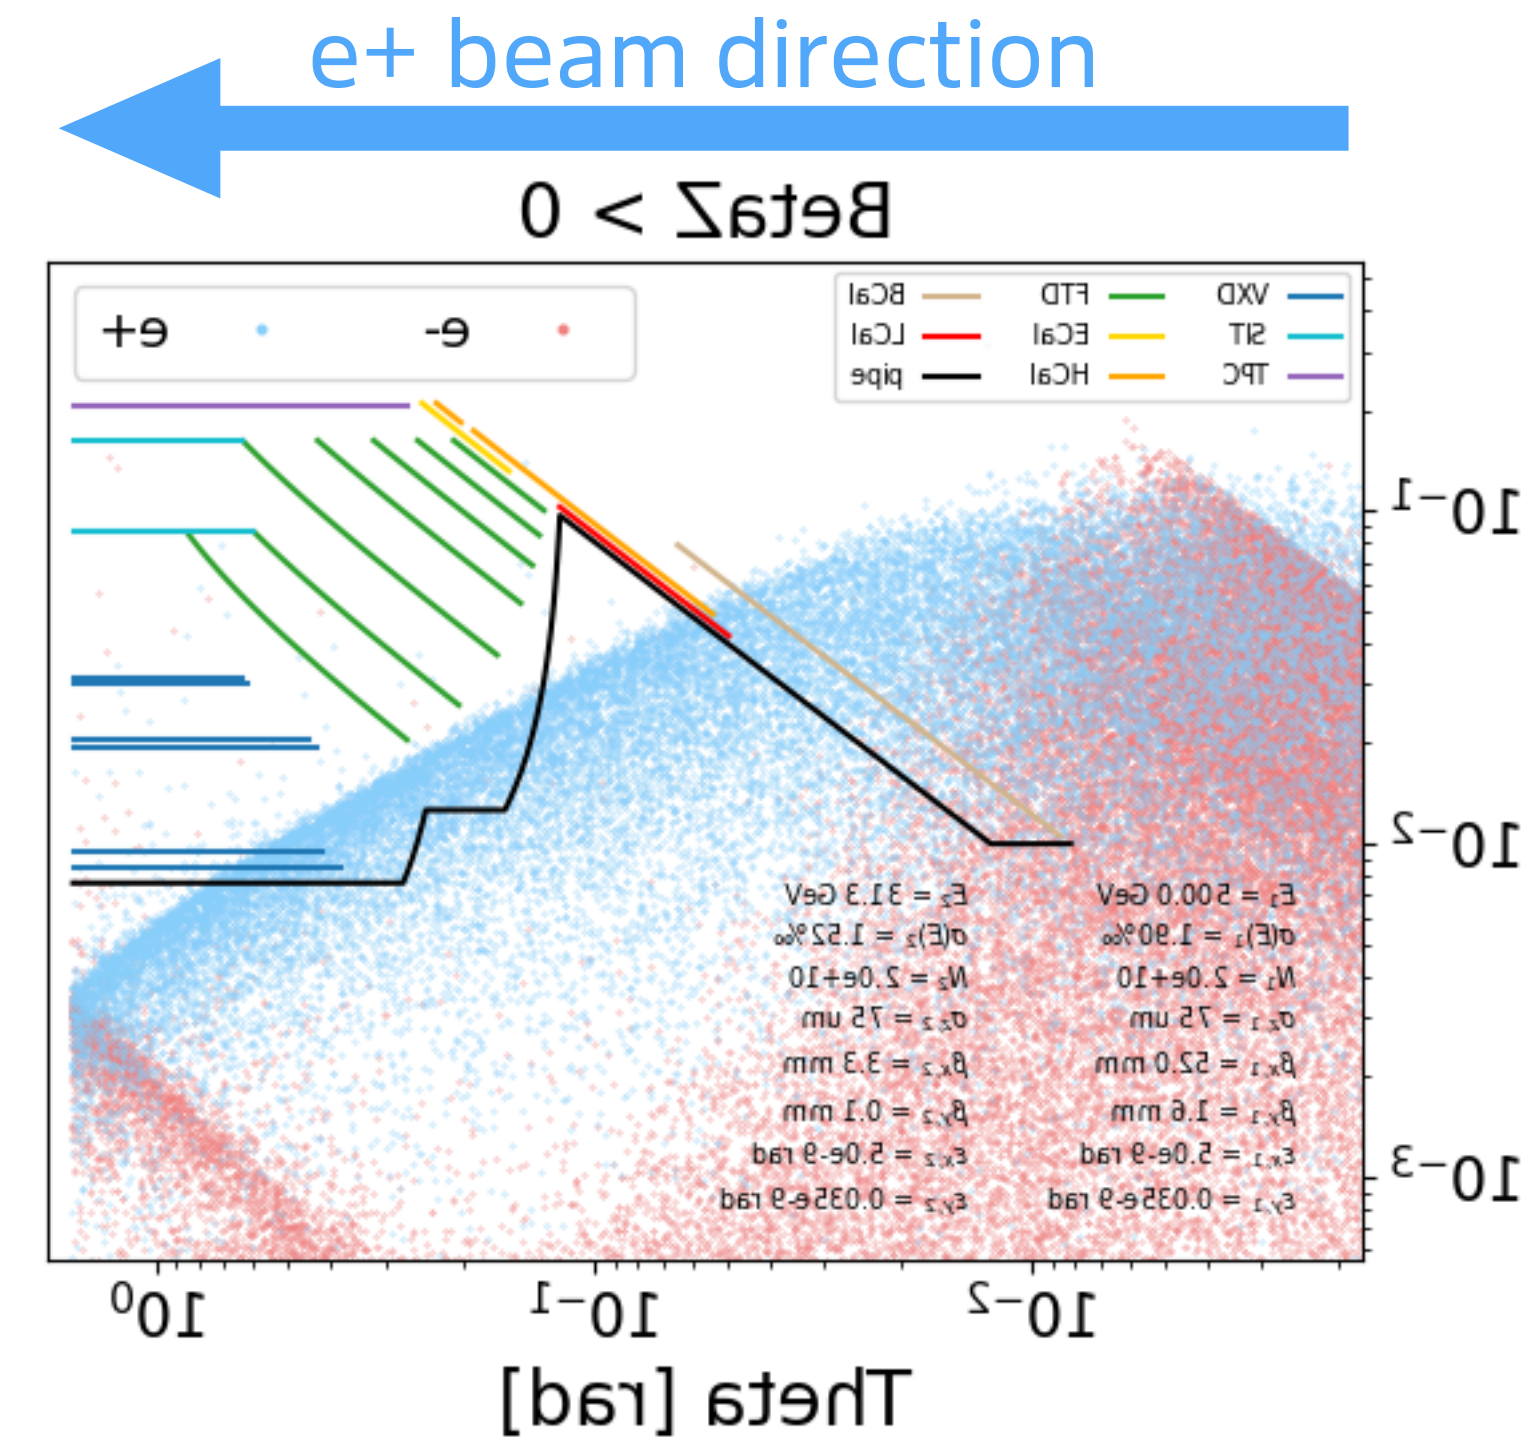

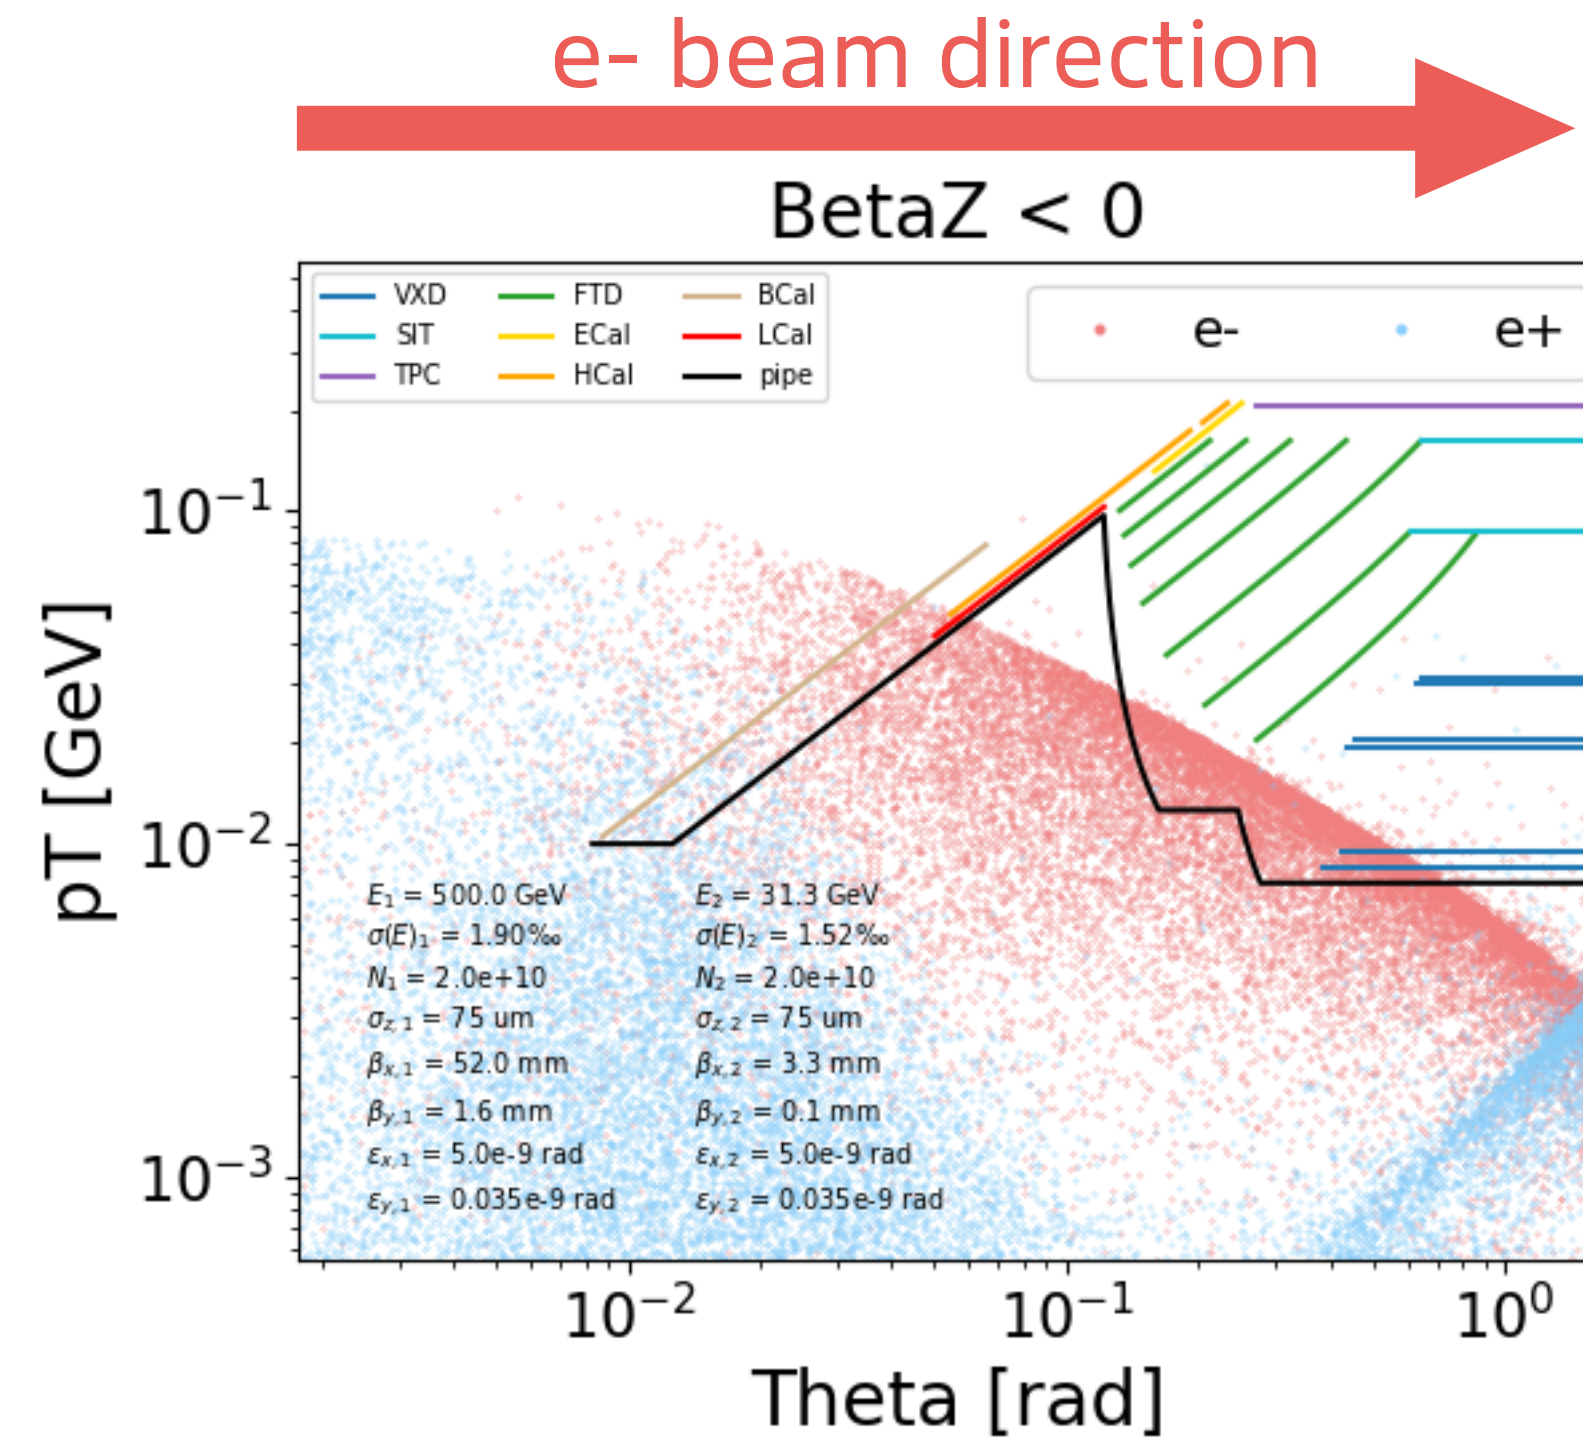

Drawing the detector like you've never seen it!

- Usual representation of this effect:
 - Let a e^-/e^+ with given (p_T, θ) . This fully defines its trajectory (helix), for a given B field.
 - **If/Where does this helix hit the detector?** => "Hit map" in the (p_T, θ) space.
- What does the detector look like in the (p_T, θ) space?

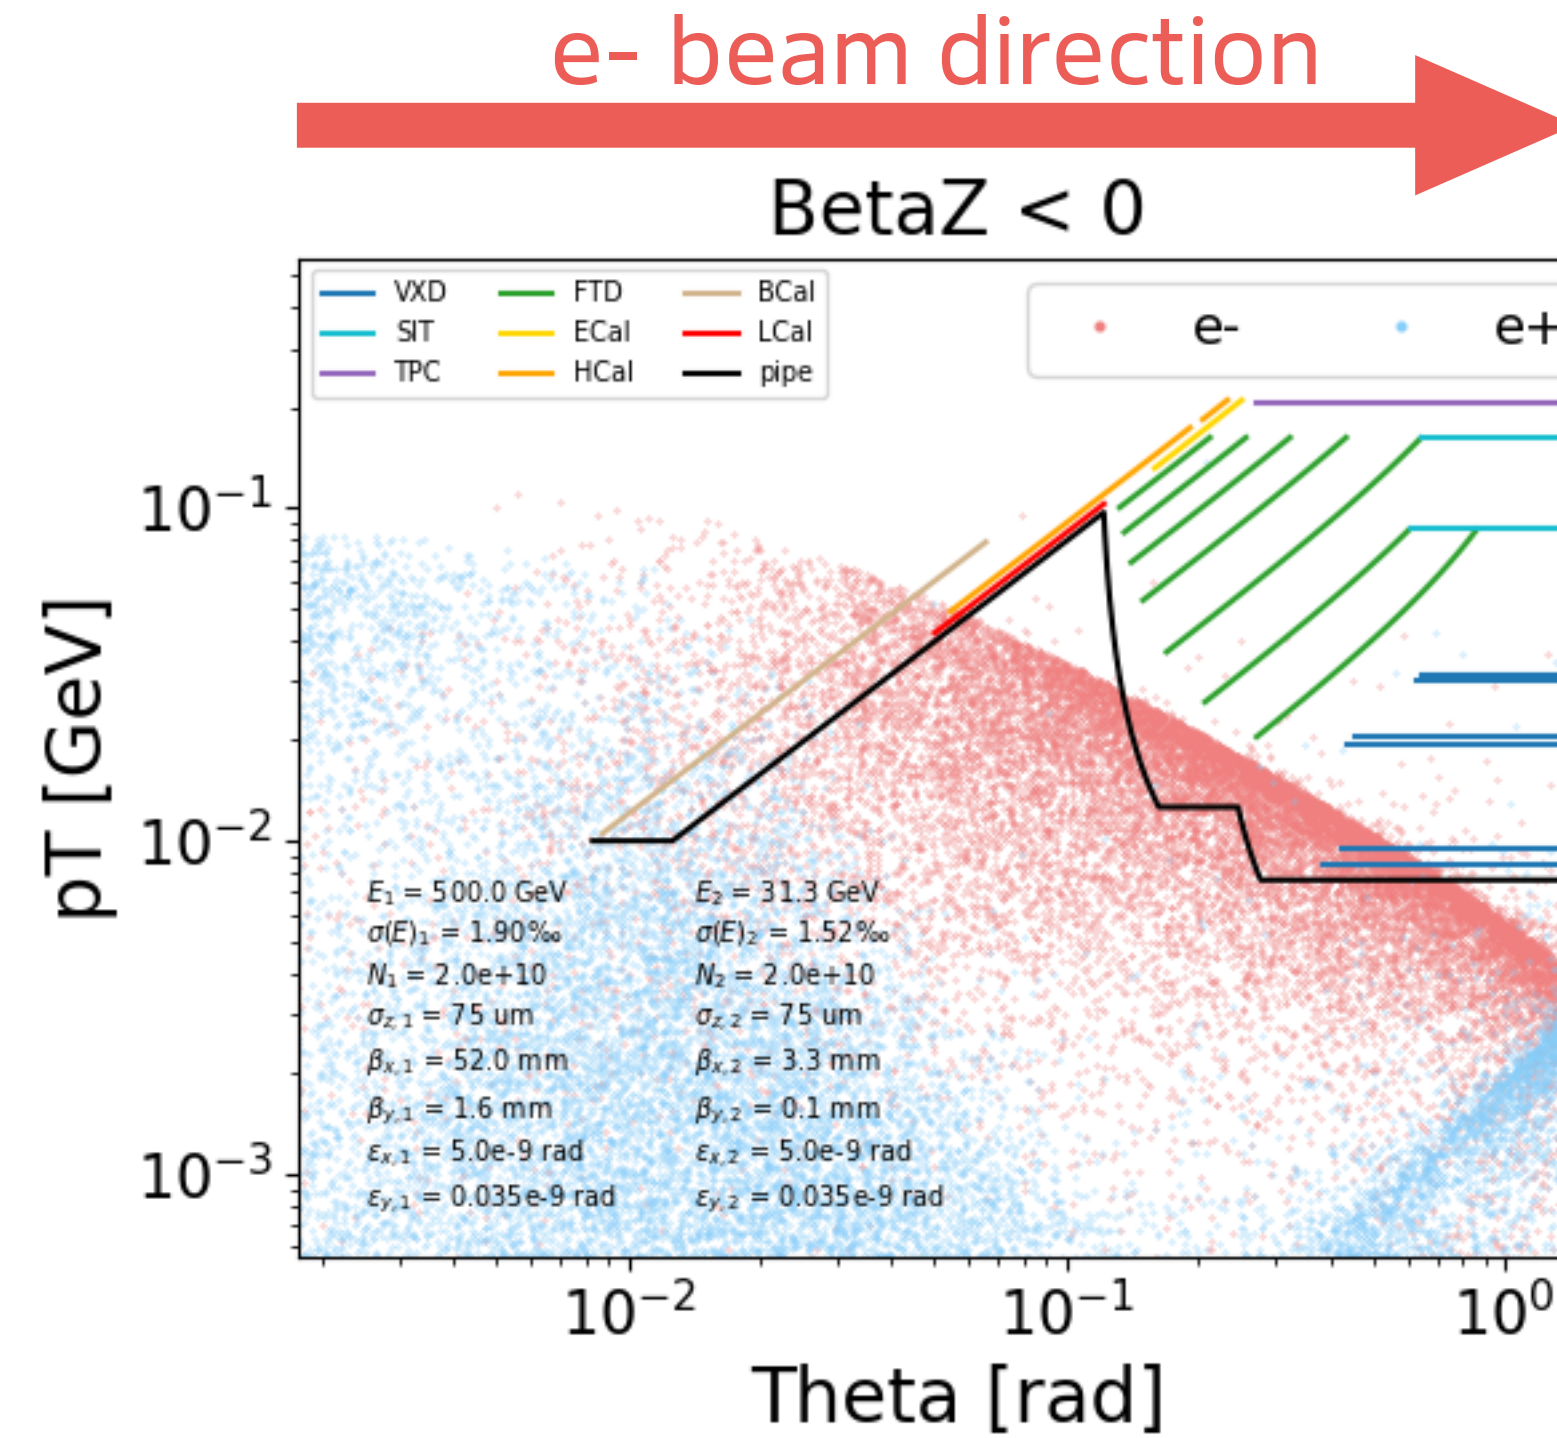

Beam-strahlung

- Baseline: symmetric-charge beams
 - Beam energy = 500 : 31.3 GeV
 - Bunch charge = **2 : 2** $\times 10^{10}$
 - Bunch size $\sigma_z =$ **75 : 75** μm
- **Pairs in the e- beam direction hit the detector.**
 - $> O(100 \text{ TeV})$ energy deposited!
 - **Fries the detector!**

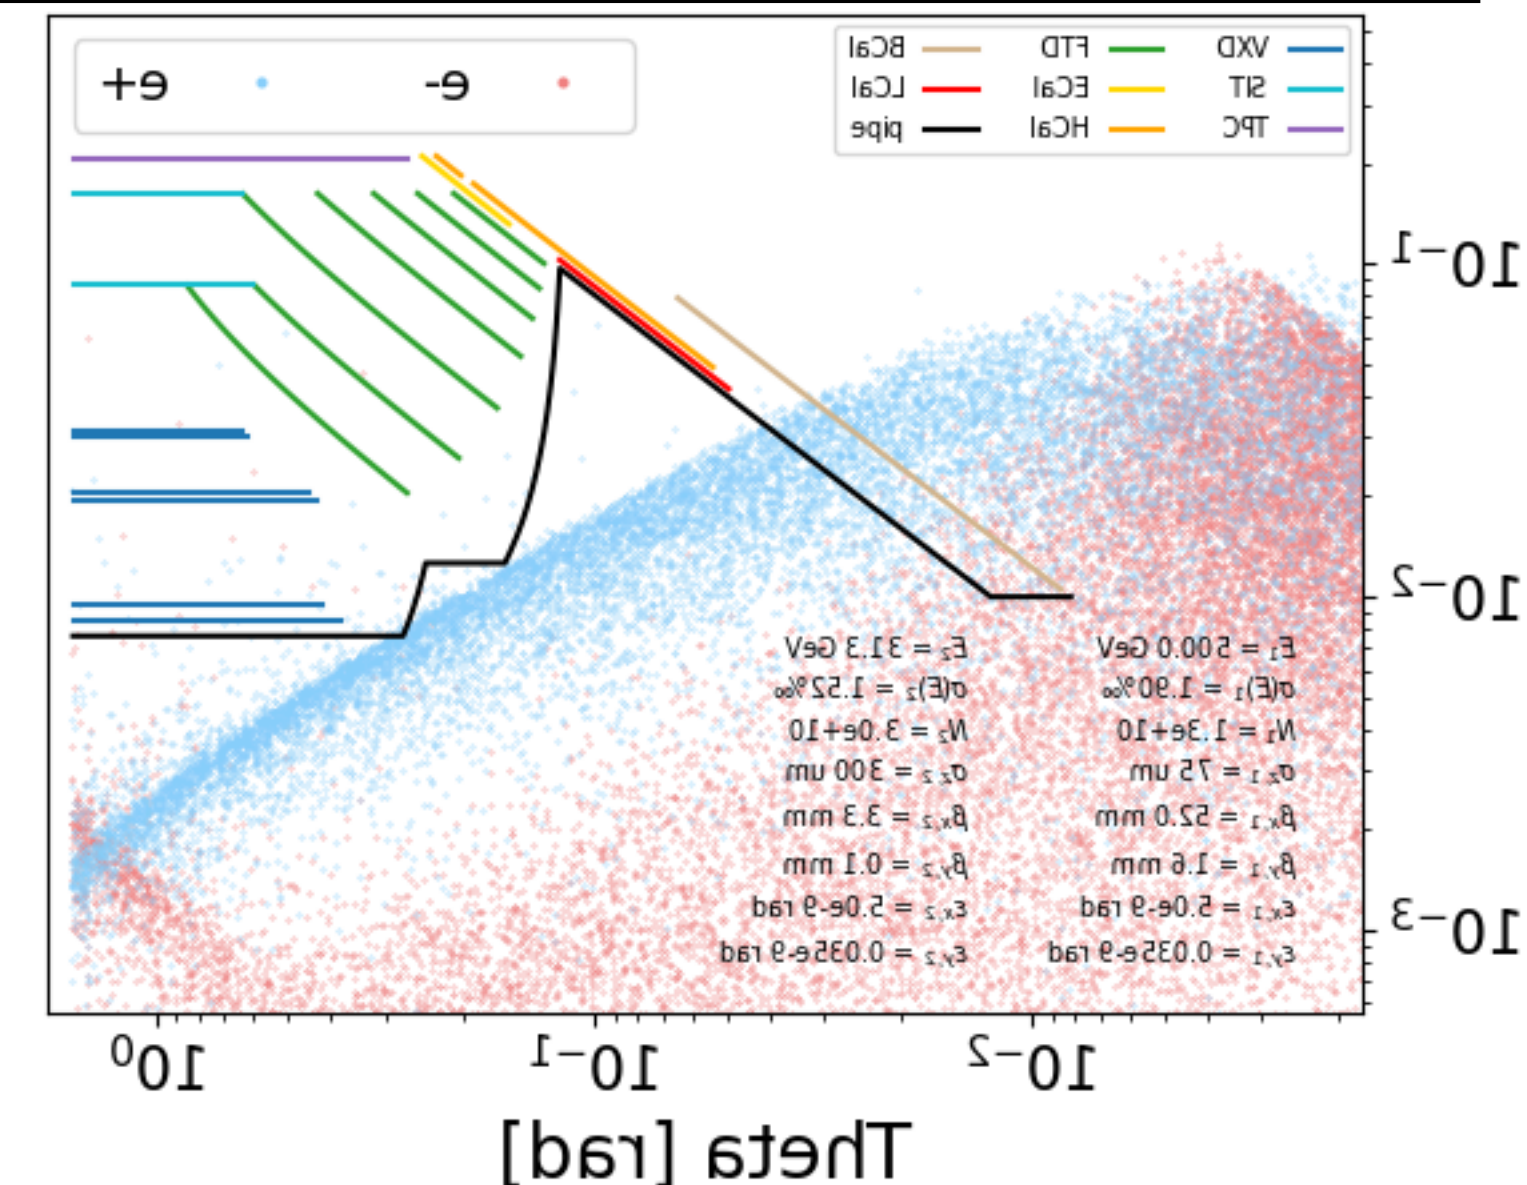

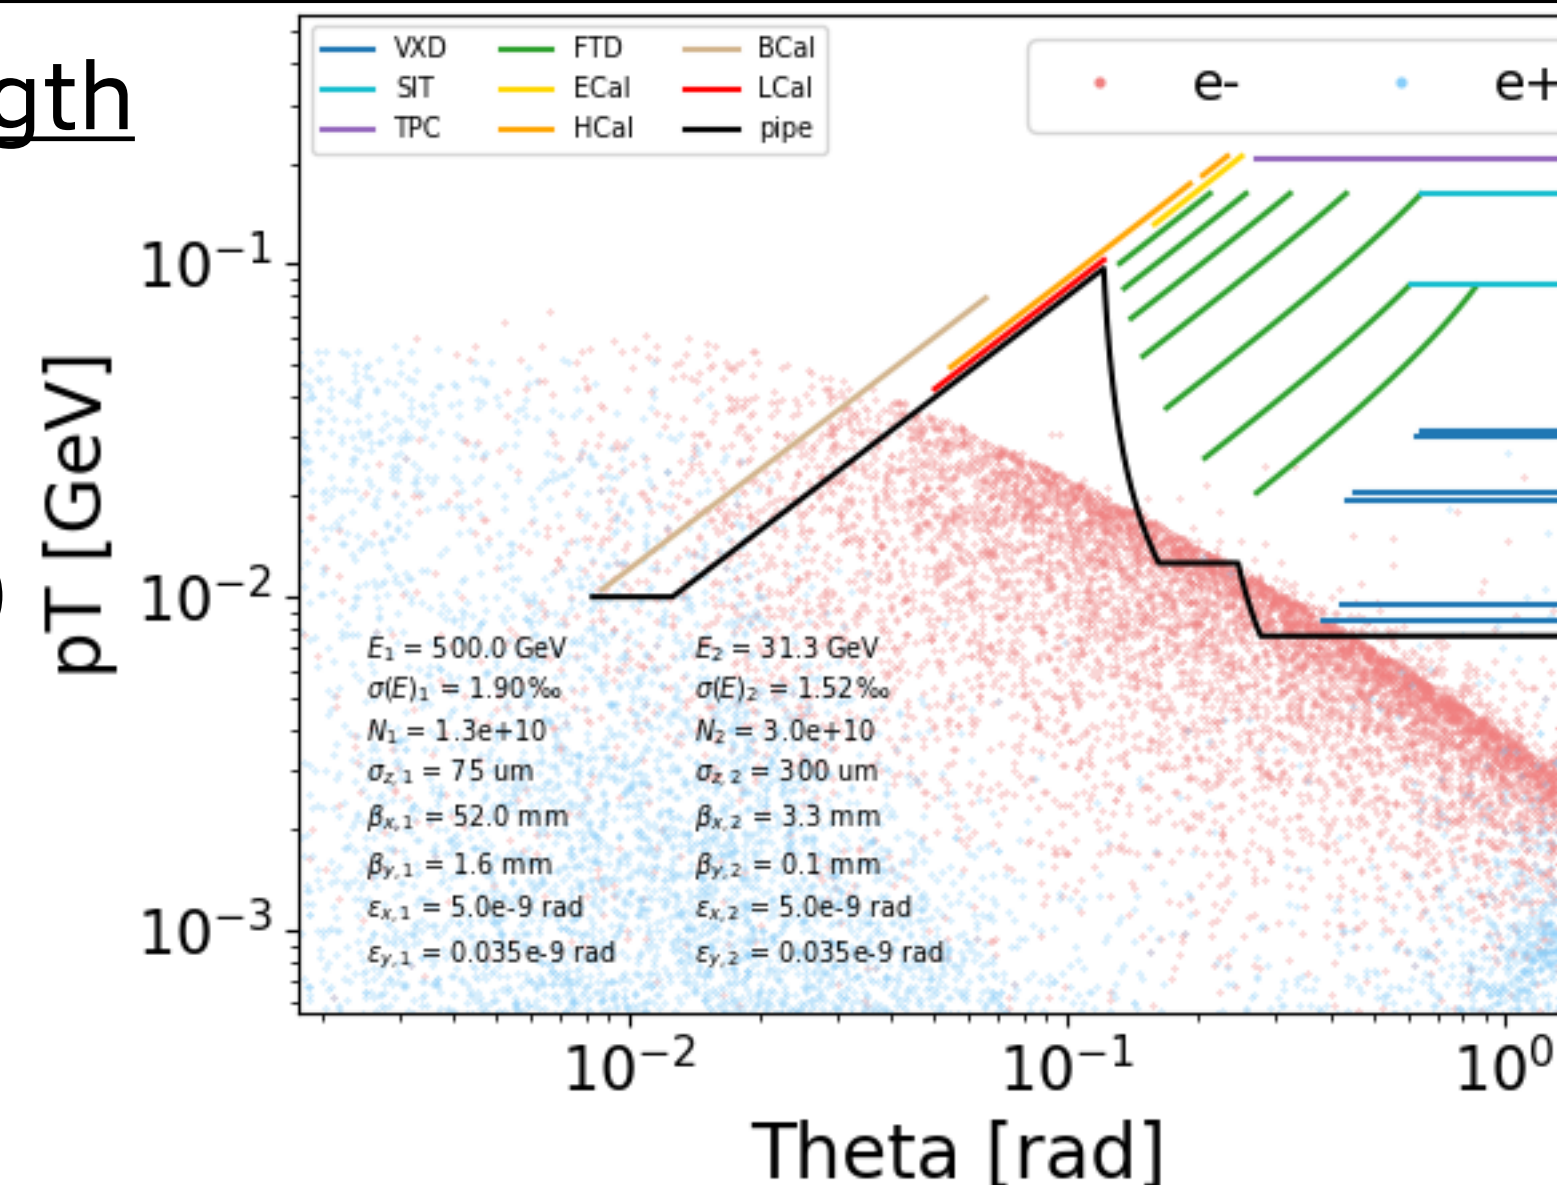

Beam-strahlung

- Baseline: symmetric-charge beams
 - Beam energy = 500 : 31.3 GeV
 - Bunch charge = **2 : 2** x 10¹⁰
 - Bunch size $\sigma_z =$ **75 : 75** μm
- **Pairs in the e- beam direction hit the detector.**
 - > O(100 TeV) energy deposited!
 - **Fries the detector!**

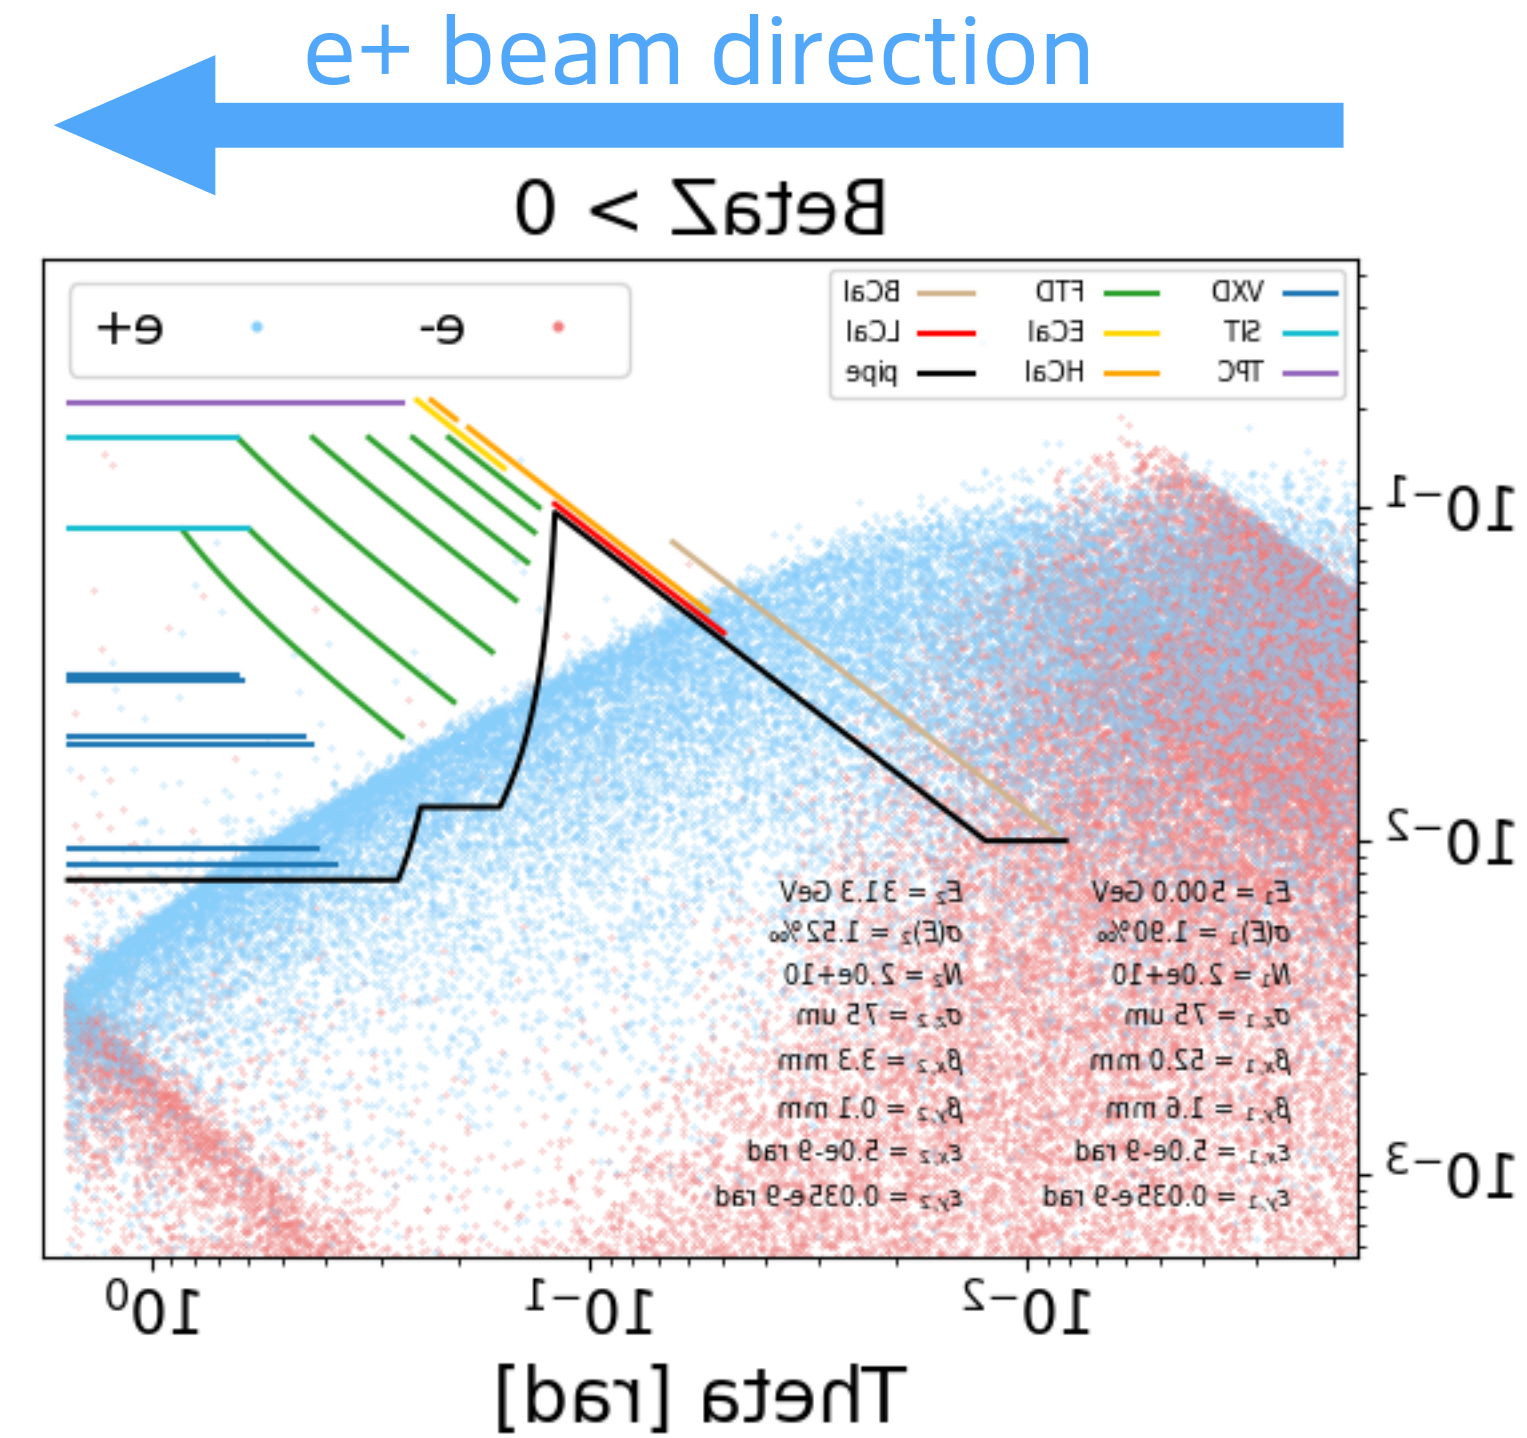

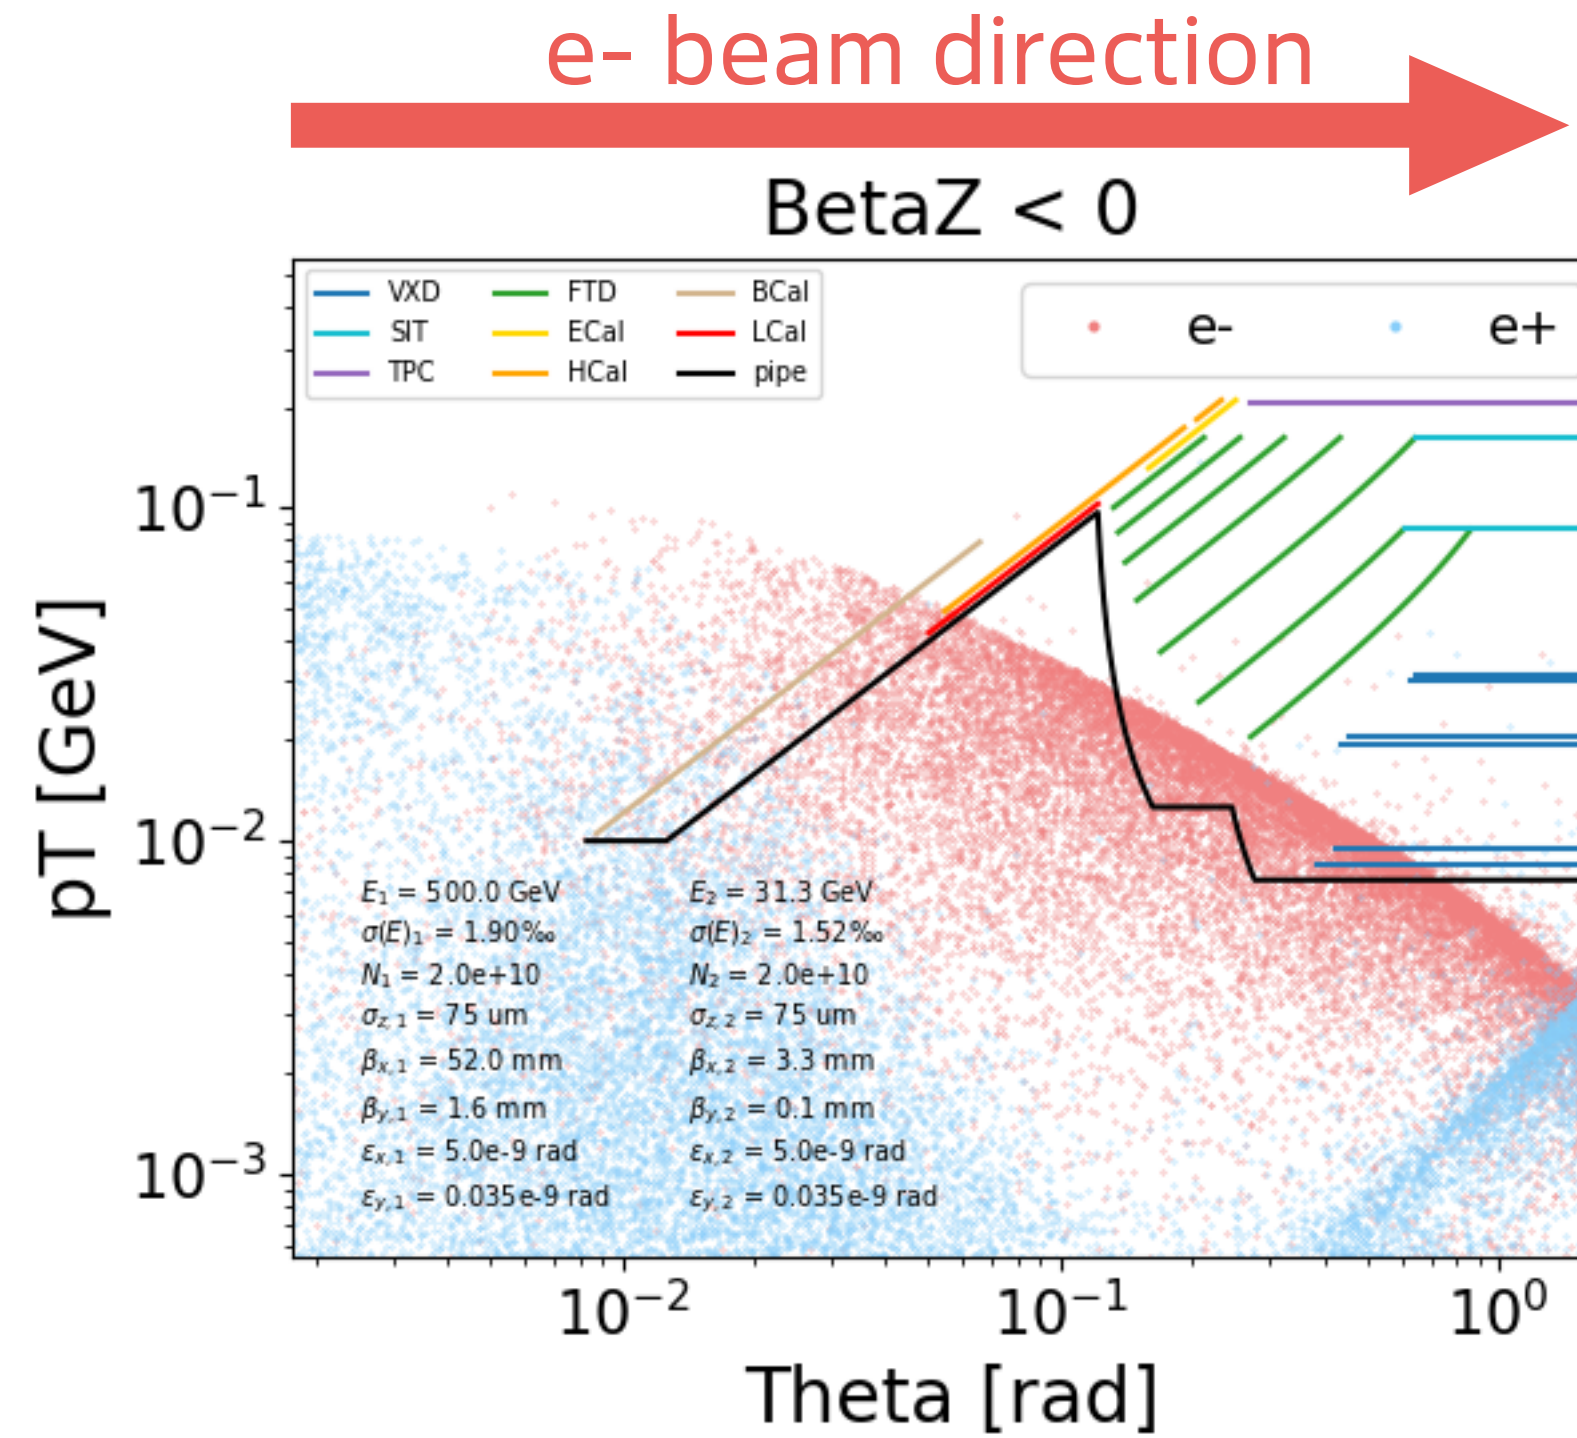

- Improved: asymmetric charge and length
 - Beam energy = 500 : 31.3 GeV
 - Bunch charge = **1.33 : 3** x 10¹⁰
 - Bunch size $\sigma_z =$ **75 : 300** μm
(cannot produce long bunches with PWFA)

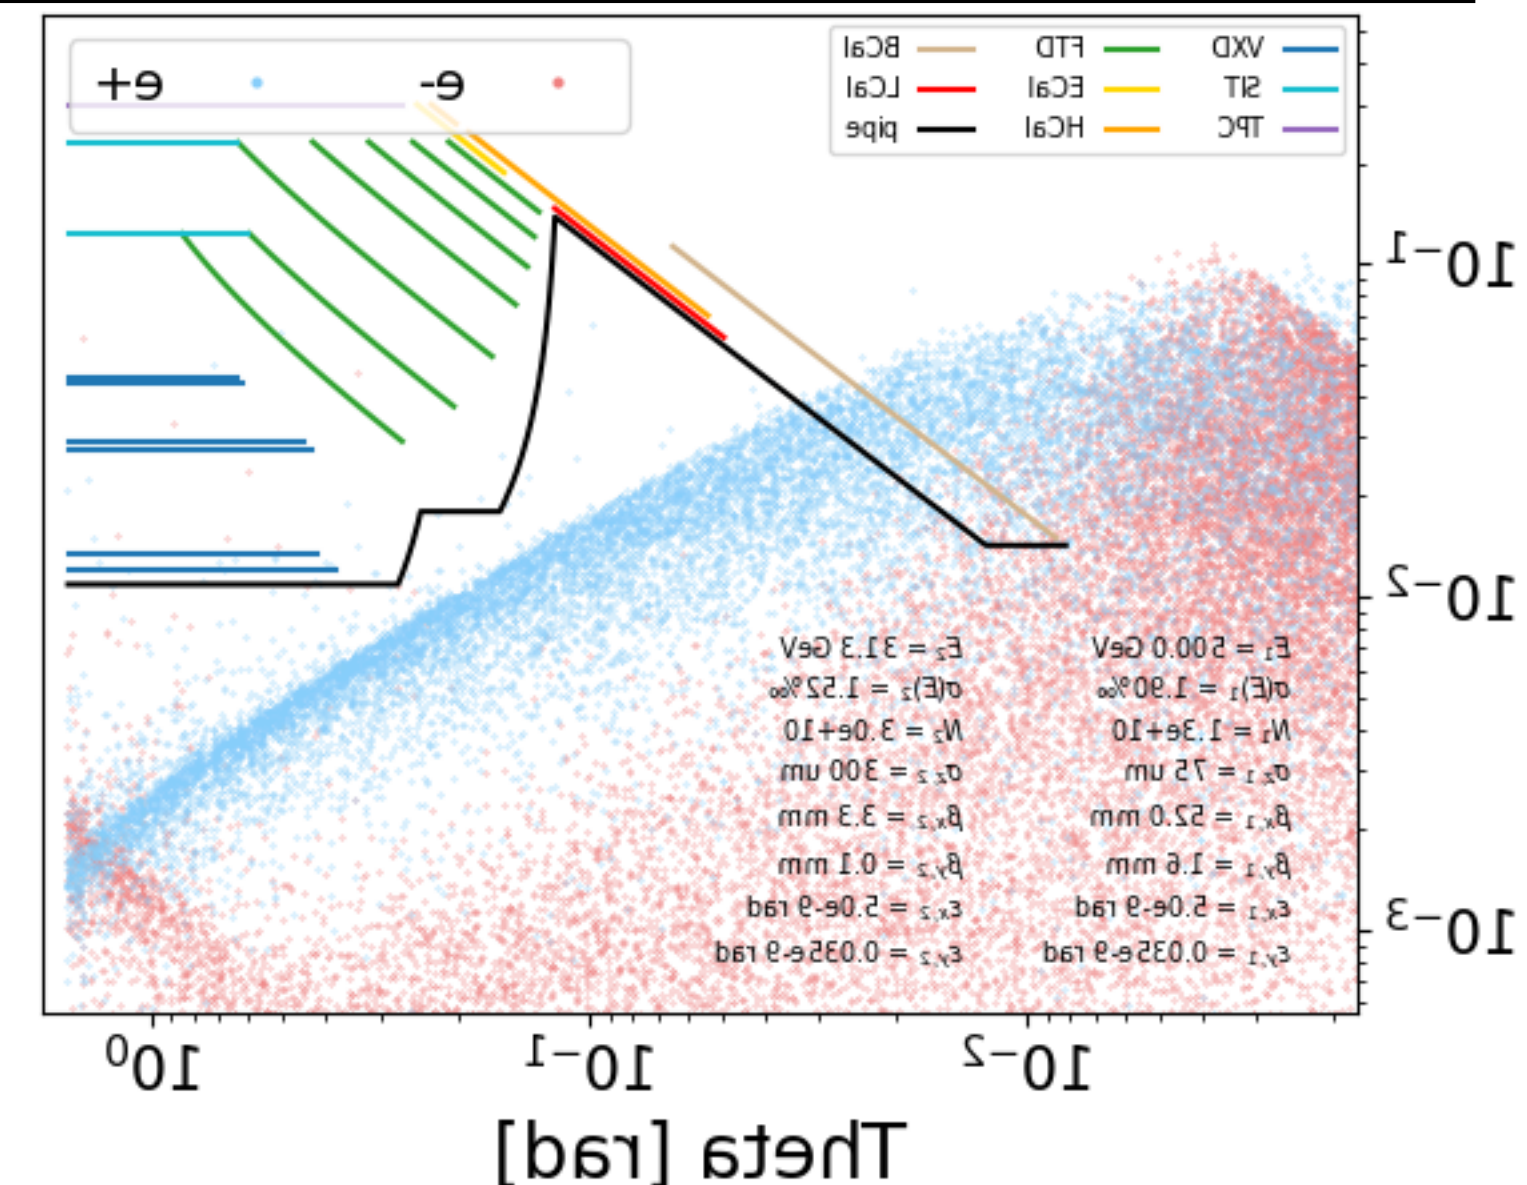

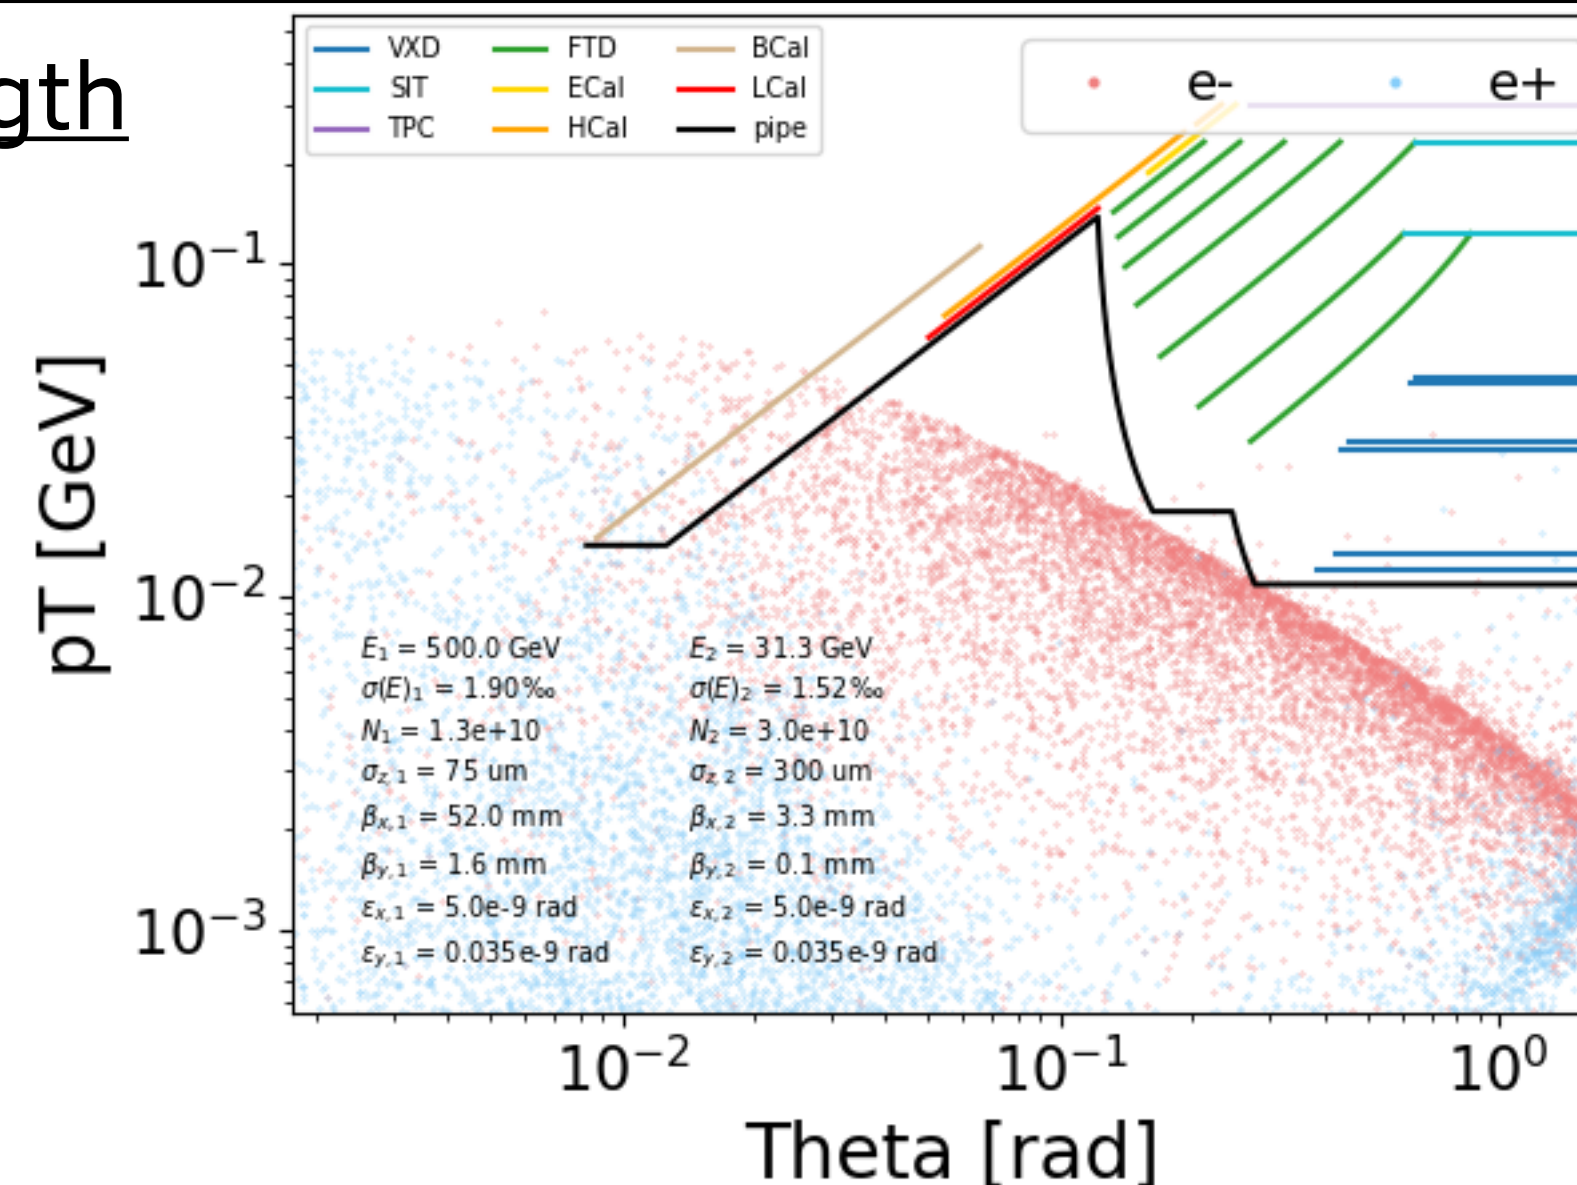

Beam-strahlung

- Baseline: symmetric-charge beams
 - Beam energy = 500 : 31.3 GeV
 - Bunch charge = **2 : 2** x 10¹⁰
 - Bunch size $\sigma_z =$ **75 : 75** μm
- **Pairs in the e- beam direction hit the detector.**
 - > O(100 TeV) energy deposited!
 - **Fries the detector!**

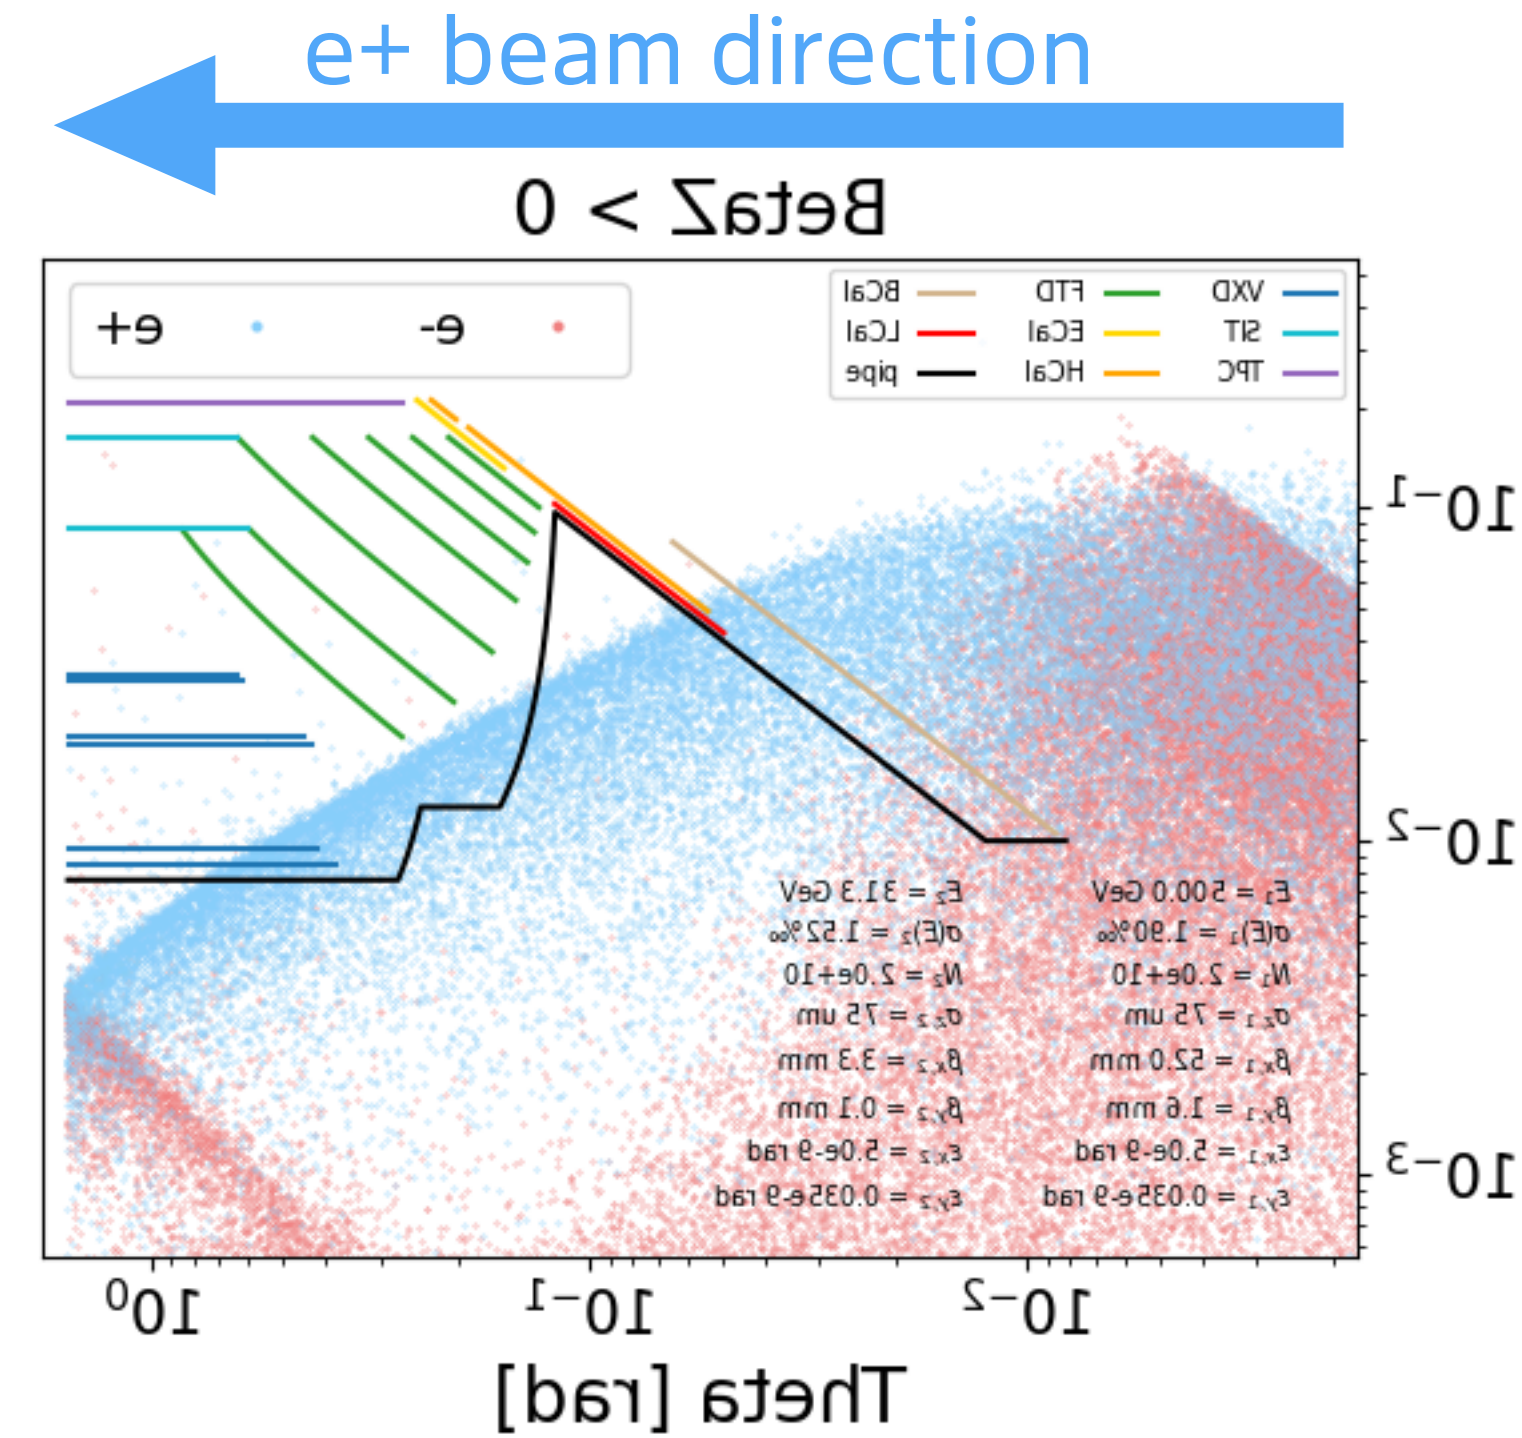

- Improved: asymmetric charge and length
 - Beam energy = 500 : 31.3 GeV
 - Bunch charge = **1.33 : 3** x 10¹⁰
 - Bunch size $\sigma_z =$ **75 : 300** μm
(cannot produce long bunches with PWFA)
- And/or **increase the magnetic field** from 3.5 T \rightarrow 5 T!

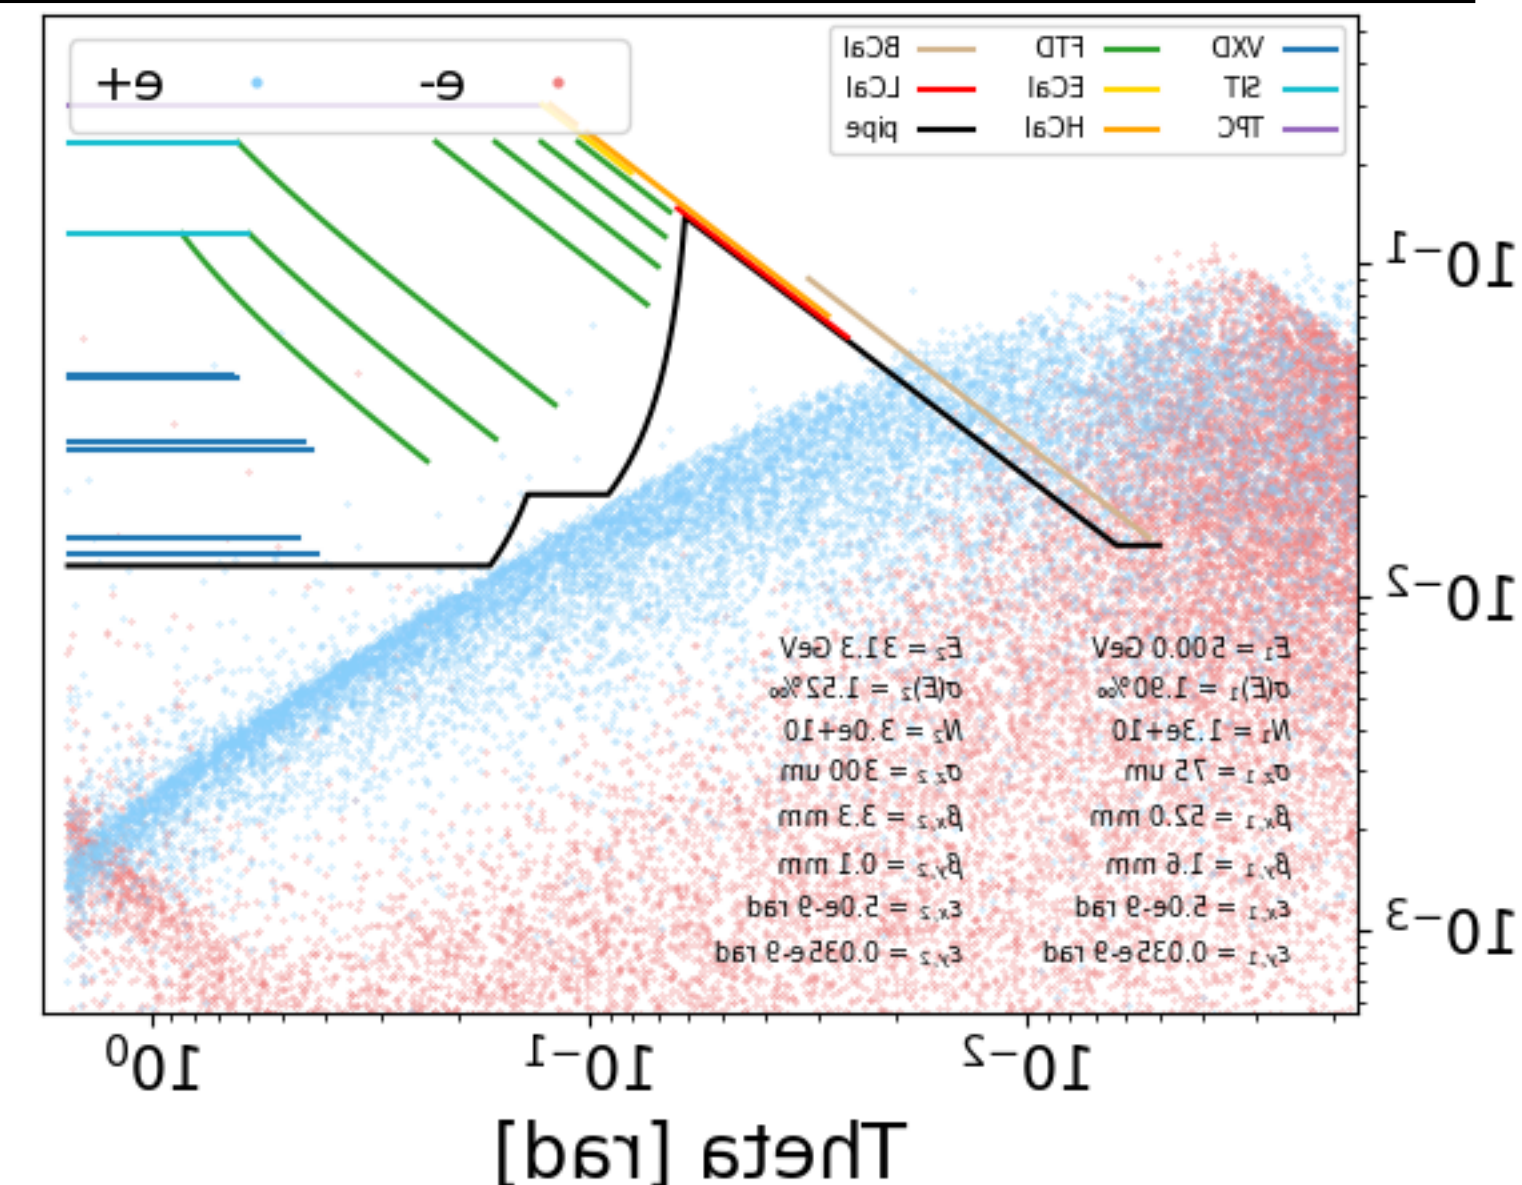

Beam-strahlung

- Baseline: symmetric-charge beams
 - Beam energy = 500 : 31.3 GeV
 - Bunch charge = **2 : 2** x 10¹⁰
 - Bunch size $\sigma_z =$ **75 : 75** μm
- **Pairs in the e- beam direction hit the detector.**
 - > O(100 TeV) energy deposited!
 - **Fries the detector!**

- Improved: asymmetric charge and length
 - Beam energy = 500 : 31.3 GeV
 - Bunch charge = **1.33 : 3** x 10¹⁰
 - Bunch size $\sigma_z =$ **75 : 300** μm
(cannot produce long bunches with PWFA)
- And/or **increase the magnetic field** from 3.5 T \rightarrow 5 T!
- Make the **detector asymmetric!**
- **More fine tuning possible!**

Beam-strahlung: impact on luminosity

- **Luminosity computed by Guinea-Pig:**
 - Total luminosity
 - Luminosity considering only events within 1% of the nominal CM energy ("peak lumi").
- **Using bunch charge $N = 1.33:3 \times 10^{10}$ with $\sigma_z = 75:300 \mu\text{m}$:**
 - **reduces beam backgrounds to acceptable levels...**
 - ... while **only reducing peak lumi by 35% compared to ILC design.**

Lumi [μb / bunch]	ILD TDR	HALHF $N = 2 : 2 \times 10^{10}$ $\sigma_z = 75 : 75 \mu\text{m}$	HALHF $N = 1.33 : 3 \times 10^{10}$ $\sigma_z = 75 : 300 \mu\text{m}$
Total lumi	1.12	1.35	0.80
Lumi within 1% of nominal CM energy	0.92	0.80	0.56
Beam backgrounds?		large	mitigated

Conclusions: HALHF the size, twice the fun!

arxiv:2303.10150

Slightly less powerful than ILC, but much more affordable!

- **Brand new project (< 1 year old), small team.**
 - Started to **look into impact on physics from asymmetric beams** (energy, charge, parameters...)
 - Iterate with accelerator colleagues to **find the best beam parameters**:
 - interplay between **lumi / background / power efficiency**.
 - Competes with other linear colliders, with **significantly lower cost and environmental footprint**.

Conclusions: HALHF the size, twice the fun!

[arxiv:2303.10150](https://arxiv.org/abs/2303.10150)

Slightly less powerful than ILC, but much more affordable!

- **Brand new project (< 1 year old), small team.**
 - Started to **look into impact on physics from asymmetric beams** (energy, charge, parameters...)
 - Iterate with accelerator colleagues to **find the best beam parameters**:
 - interplay between **lumi / background / power efficiency**.
 - Competes with other linear colliders, with **significantly lower cost and environmental footprint**.
- **No show-stoppers so far, but many challenges remain:**
 - **Plasma acceleration**: beam charge, repetition rate, power dissipation, polarisation...
 - Staging PWFA cell concept needs ~10 years development.
 - **Detector design in the forward region**.
 - => next step: modify full-sim ILD into an asymmetric detector and play with B field.
 - => Then re-run physics benchmarks (Higgs recoil, F/B asymmetry)
 - **Luminosity measurement** (Bhabha counting) to be studied.
 - Upgradability to higher CM energy is unclear (until PWFA for e+ becomes available?).
- **Many possibilities for new studies** (physics cases, detector design...)!

Thanks for your attention!
