Future lepton colliders landscape

<u>Circular</u>

- Expensive: O(>10B)
- Large environmental impact
- Power hungry
- High lumi at "low" energy
- Upgradable to hadron collider

Cost (€ and environmental) driven by length, not operation

DESY. | <u>Antoine Laudrain</u> (he/him) 📧 | ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory

- Expensive: very roughly O(5B)
- Slightly lower environmental impact
- A bit less power hungry
- Higher lumi at higher energies
- Extendable to higher energy

"Simply" decrease the size of the tunnel...

But shorter tunnel = lower beam energy => 6

DESY. Antoine Laudrain (he/him) 📧 | ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory

"Simply" decrease the size of the tunnel...

- But shorter tunnel = lower beam energy => 6
- Except if you can get higher gradients! ullet
 - RF: ~30 MV/m (ILC)

Plasma wake field acceleration (PWFA) cavities ~ expected O(1000 MV/m) — ie x30!

"Simply" decrease the size of the tunnel...

- But shorter tunnel = lower beam energy => 6
- Except if you can get higher gradients!
 - RF: ~30 MV/m (ILC)
- **PWFA** not yet available: **requires** ~10 years of development...
 - ... but is relevant given current timescales for future accelerators.
 - **Only for electron acceleration**.

• Plasma wake field acceleration (PWFA) cavities ~ expected O(1000 MV/m) — ie x30!

The HALHF concept

Hybrid Asymmetric Linear Higgs Factory

- : mix of plasma (e⁻) and SRF (e+) acceleration
- : (not circular)
- : (but could go up to ttbar threshold)

Length = ~3.3 km: similar to XFEL@DESY $Cost = ~2.1 B \in +/-25\% = ~ ILC/4 = ~ EIC$

DESY. Antoine Laudrain (he/him) ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory

arxiv:2303.10150

: 500 GeV e⁻ & 31.3 GeV e⁺ (also gives $\sqrt{s} = 250$ GeV)

Length dominated by e- BDS Cost still dominated by tunnel and RF linac

Disclaimer

- I am **not** an accelerator physicist, not a specialist of PWFA.
- <u>Assumptions for the rest of this talk:</u>
 - years.
 - We can build a collision-quality beam in ~5 more years.
 - PWFA for positron is still not available.
- These might be strong assumptions, but we need a starting point to think about a detector!
 - => In the following I focus on the physics and detector side, not accelerator side.

Electron-beam driven PWFA is proven working for electron acceleration in ~10-15

Now the questions arise

- Asymmetric beam energies => boosted topologies ($\gamma \sim 2.1$)
 - Can we still do physics in such conditions?
 - There is experience with boosted collision: $\gamma = 3$ at HERA...
 - … Yet, it's not quite the same physics
- **Study cases**:
 - **Higgs mass** measurement (ZH recoil),
 - Forward/backward asymmetry measurement.
- Other question: how does it impact the energy efficiency?
- Not studied here:

 - Boost most likely improves jet flavour-tagging. Luminosity measurement is probably not as straightforward.

DESY. Antoine Laudrain (he/him) 📧 | ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory

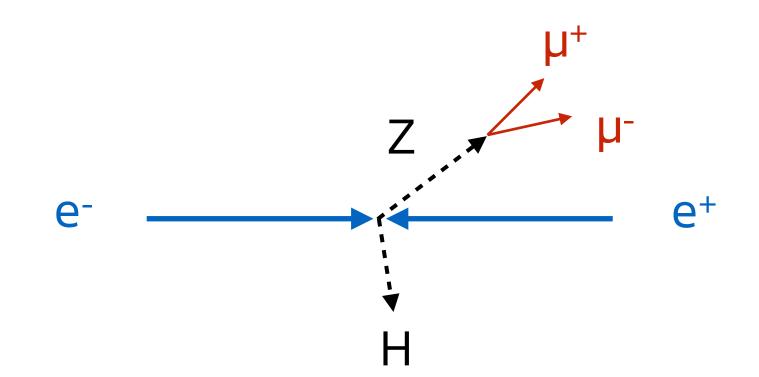

Impact on physics: Higgs

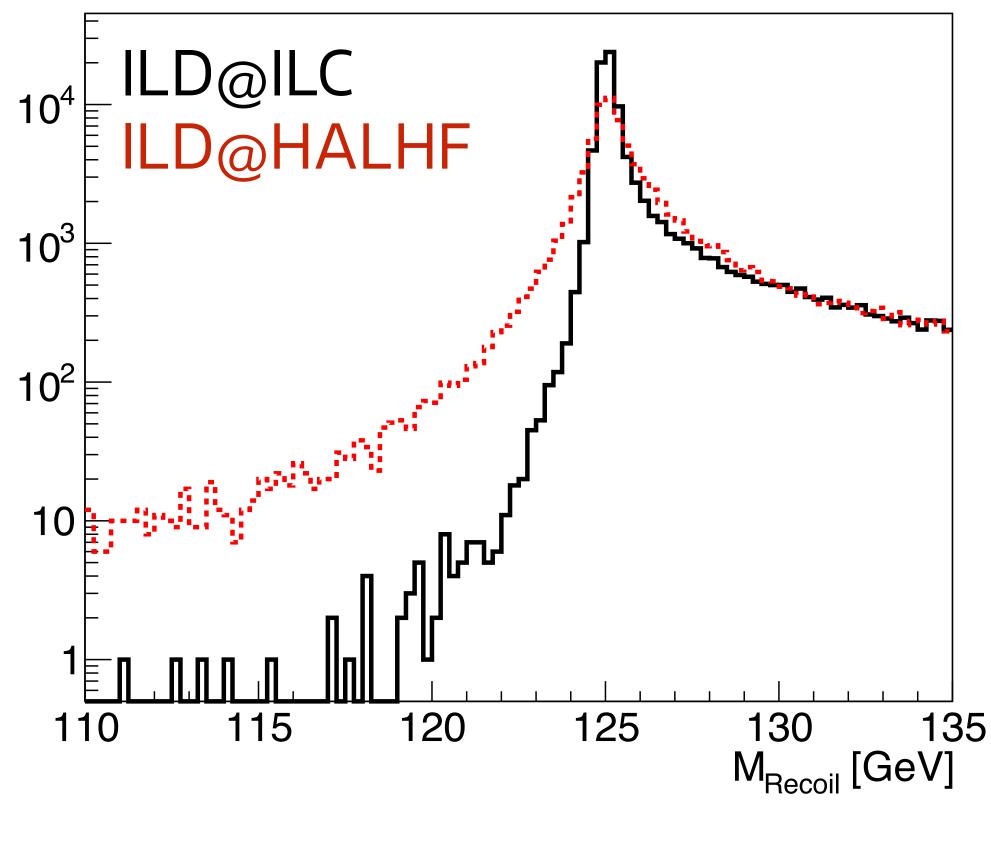

- Process: $e^+e^- \rightarrow Z(\mu^+\mu^-)H$
- Measure Higgs mass via recoil mass.
- Detector: ILD with fast simulation (SGV), including correct tracking.

Resolution loss due muons being boosted forward:

- less lever arm => lower muon momentum resolution.
- $\sigma_{\text{ILD}_{@}\text{HALHF}} = 2.2 \times \sigma_{\text{ILD}_{@}\text{ILC}}$

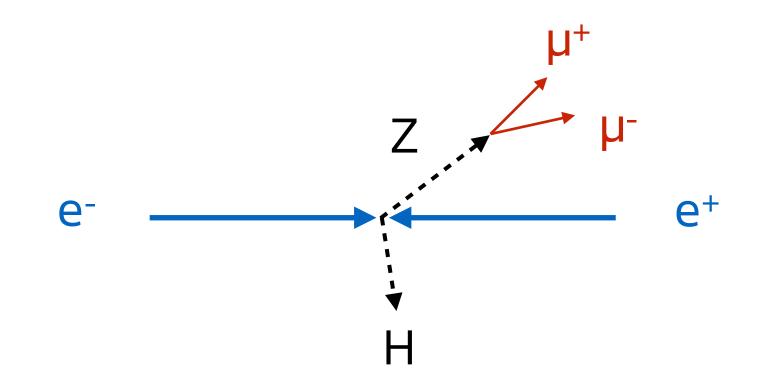

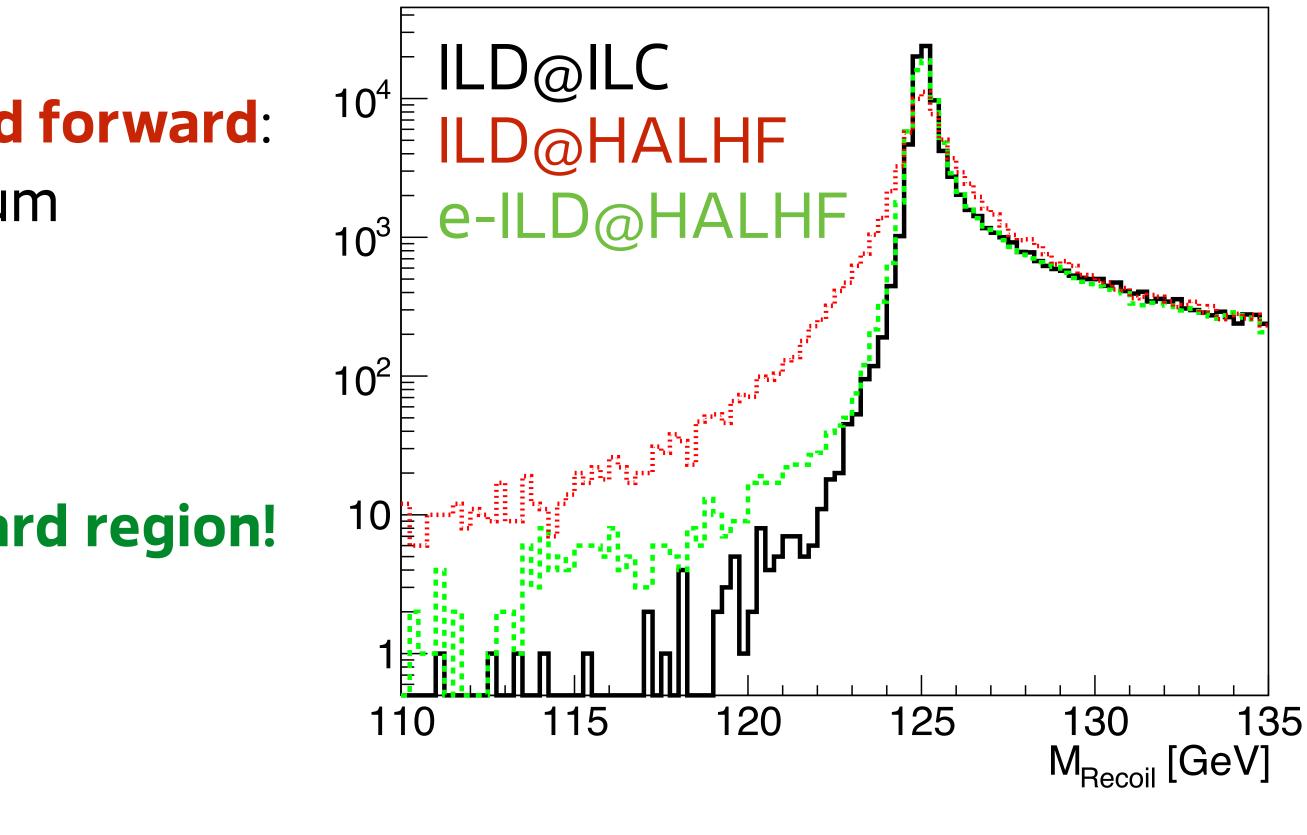

Impact on physics: Higgs

- Process: $e^+e^- \rightarrow Z(\mu^+\mu^-)H$
- Measure Higgs mass via recoil mass.
- Detector: ILD with fast simulation (SGV), including correct tracking.
- **Resolution loss due muons being boosted forward**:
 - less lever arm => lower muon momentum resolution.
 - $\sigma_{\text{ILD}_{@}\text{HALHF}} = 2.2 \times \sigma_{\text{ILD}_{@}\text{ILC}}$
- Mitigation: extend the barrel in the forward region!
 - $\sigma_{e-ILD_{@}HALHF} = 1.2 \times \sigma_{ILD_{@}ILC}$
 - => loss of only 20% on recoil mass.

Antoine Laudrain (he/him) 📧 📔 ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory DESY.

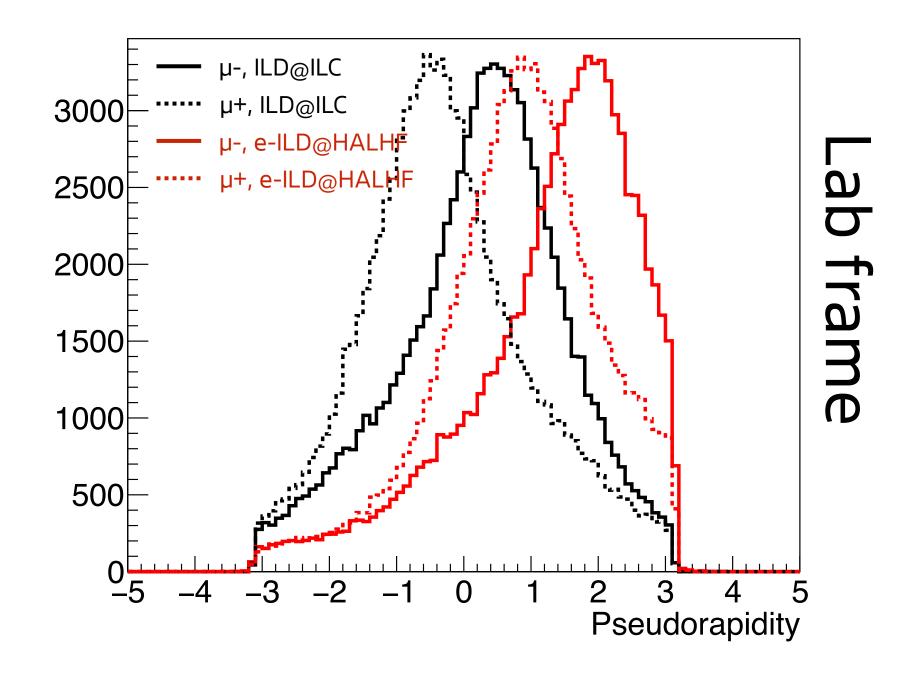

Impact on physics: F/B asymmetry

- Process: $e^+e^- \rightarrow \mu^+\mu^-$
 - [black] ILD@ILC
 - [red] extended ILD @ HALHF

Impact on physics: F/B asymmetry

- Process: $e^+e^- \rightarrow \mu^+\mu^-$
 - [black] ILD@ILC
 - [red] extended ILD @ HALHF

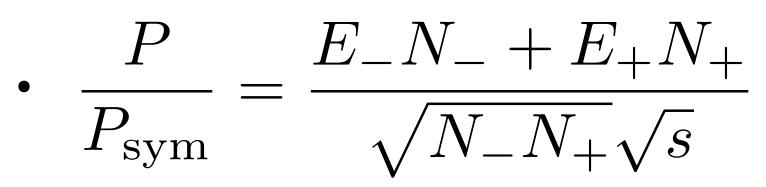

- Move to the CM frame to ease the comparison: Core of distribution is the same (as expected)
 - - => in particular: same width
 - Tail extends on one side and is cut on the other.
- Lose on one side, but gain on the other.
- => Need more studies, especially for systematic **uncertainties** (since setup itself is asymmetric).

Power efficiency

The asymmetry strikes back

 Asymmetric energy => loss of "energy efficiency" compared to symmetric case (some energy goes in the boost)

- With:

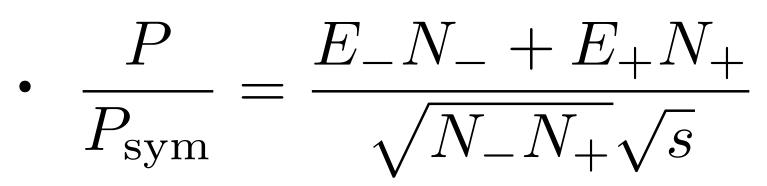

• $E_{-} = 500 \text{ GeV and } E_{+} = 31 \text{ GeV},$ • $N_{-} : N_{+} = 2 : 2 \times 10^{10} \text{ particles / bunch}, \ \mathbf{F} = 2.13 \ (= boost \ factor)$

Power efficiency

The asymmetry strikes back

 Asymmetric energy => loss of "energy efficiency" compared to symmetric case (some energy goes in the boost)

- With:
 - $E_{-} = 500 \text{ GeV} \text{ and } E_{+} = 31 \text{ GeV},$
 - $N_{-}: N_{+} = 2: 2 \times 10^{10}$ particles / bunch,
- - decreasing the bunch charge of the high-energy beam (e-)
 - <u>and</u> increasing the bunch charge of the low-energy beam (e+).

$$P/P_{sym} = 2.13$$
 (= boost factor)

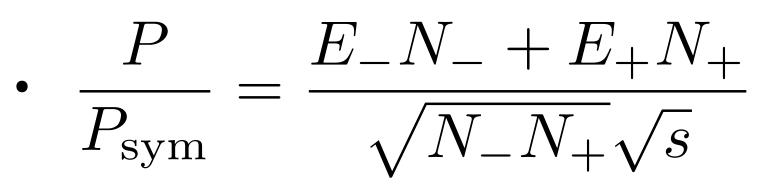

• But what matters is luminosity $\mathscr{L} \propto N_{-} \times N_{+} =$ same \mathscr{L} while being more energy-efficient by:

Drawing the detector like you've never seen it!

- Usual representation of this effect:
 - Let a e-/e+ with given (pT, θ). This fully defines its trajectory (helix), for a given B field.
 - If/Where does this helix hit the detector? => "Hit map" in the (pT, θ) space.

 - Fries the detector!

- Improved: asymmetric charge and length
 Beam energy = 500 : 31.3 GeV
 Bunch charge = 1.33 : 3 x 10¹⁰
 - Bunch charge = $1.55 : 5 \times 10^{10}$ • Bunch size $\sigma_z = 75 : 300 \ \mu m$ (cannot produce long bunches with PWFA) $= 10^{10}$
- And/or increase the magnetic field from $3.5 T \rightarrow 5 T!$
- Make the detector asymmetric!
- More fine tuning possible!

DESY. Antoine Laudrain (he/him) 📧 🕴 ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory

Beam-strahlung: impact on luminosity

- Luminosity computed by Guinea-Pig:
 - Total luminosity
- - Using bunch charge N = 1.33:3 x 10^{10} with $\sigma_z = 75:300 \ \mu m$: reduces beam backgrounds to acceptable levels... ... while only reducing peak lumi by 35% compared to ILC design.

Antoine Laudrain (he/him) 📧 📔 ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory DESY.

Luminosity considering only events within 1% of the nominal CM energy ("peak lumi").

HALHF N = 2 : 2 x 10^{10} $\sigma_z = 75 : 75 \ \mu m$	HALHF N = $1.33 : 3 \times 10^{10}$ $\sigma_z = 75 : 300 \mu$ m
1.35	0.80
0.80	0.56
large	mitigated

Conclusions: HALHF the size, twice the fun! Slightly less powerful than ILC, but much more affordable!

- Brand new project (~1 year old), small team.

 - Iterate with accelerator colleagues to find the best beam parameters:
 - interplay between lumi / background / power efficiency.
 - Competes with other linear colliders, with significantly lower cost and environmental footprint.

Started to look into impact on physics from asymmetric beams (energy, charge, parameters...)

Conclusions: HALHF the size, twice the fun! Slightly less powerful than ILC, but much more affordable!

• Brand new project (~1 year old), small team.

- Iterate with accelerator colleagues to find the best beam parameters:
 - interplay between lumi / background / power efficiency.
- Competes with other linear colliders, with significantly lower cost and environmental footprint.
- No show-stoppers so far, but many challenges remain:
 - Plasma acceleration: beam charge, repetition rate, power dissipation, polarisation...
 - Staging PWFA cell concept needs <u>~10 years development</u>.
 - Detector design in the forward region (see next slide).
 - Luminosity measurement (Bhabha counting) to be studied.
 - Upgradability to higher CM energy is unclear (until PWFA for e+ becomes available?).

Many possibilities for new studies (physics cases, detector design...)!

Antoine Laudrain (he/him) 📧 🕴 ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory DESY.

• Started to look into impact on physics from asymmetric beams (energy, charge, parameters...)

Next steps to study the detector design

- 1. Need simulated files with asymmetric beam energies.
 - We already have the large ILC/ILD dataset...
 - As a first step, "simply" boost all particles according to the HALHF configuration!
 - Boosting script ready
- 2. Modify full-sim ILD into an asymmetric detector, and re-simulate with the above samples. • Extend subsystems in the forward direction (and possibly reduce backward extent). Play with magnetic field configuration (additional forward dipole / solenoid / toroid). • Current work: technicalities sorted out, now is time to play!
- 3. **Re-run physics benchmarks** (Higgs recoil, F/B asymmetry)
 - using "boosted ILD dataset"
 - and modified detector configuration(s)
- 4. Additional studies: flavour tagging, luminosity, ...

DESY. Antoine Laudrain (he/him) 📧 🕴 ILD meeting — 15.01.2024 — Hybrid Asymmetric Linear Higgs Factory

Thanks for your attention!

Looking forward to show new results soon!

Questions?

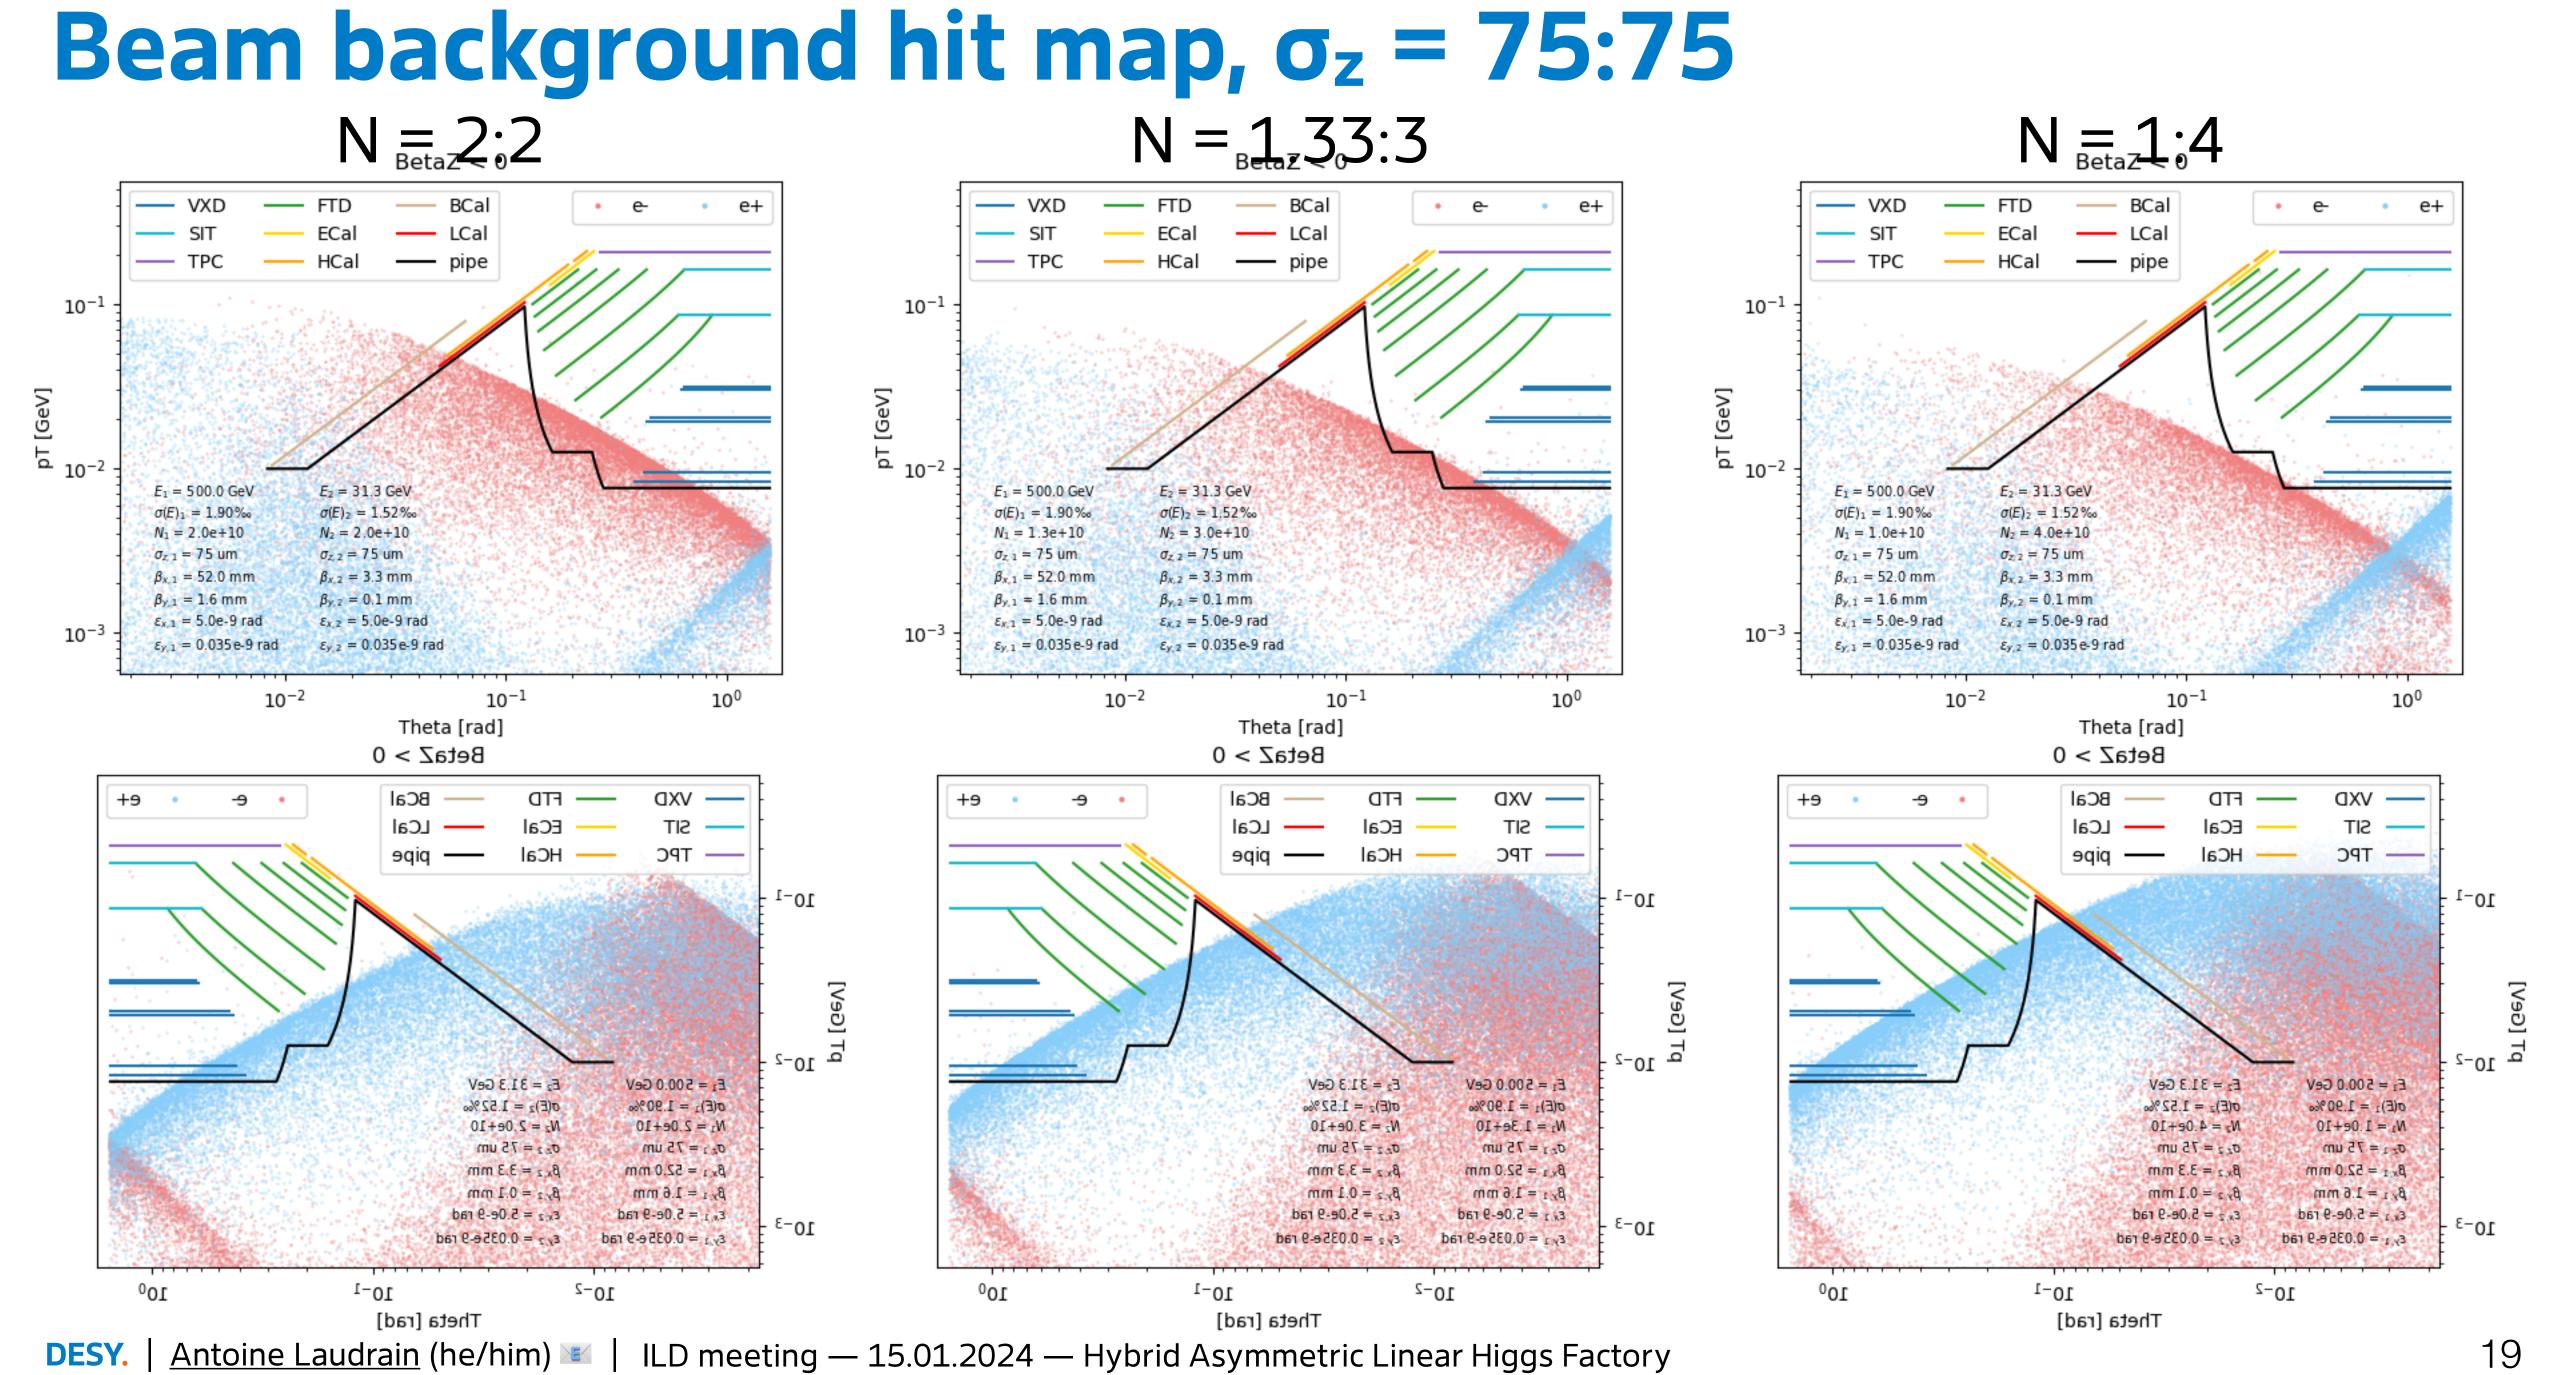

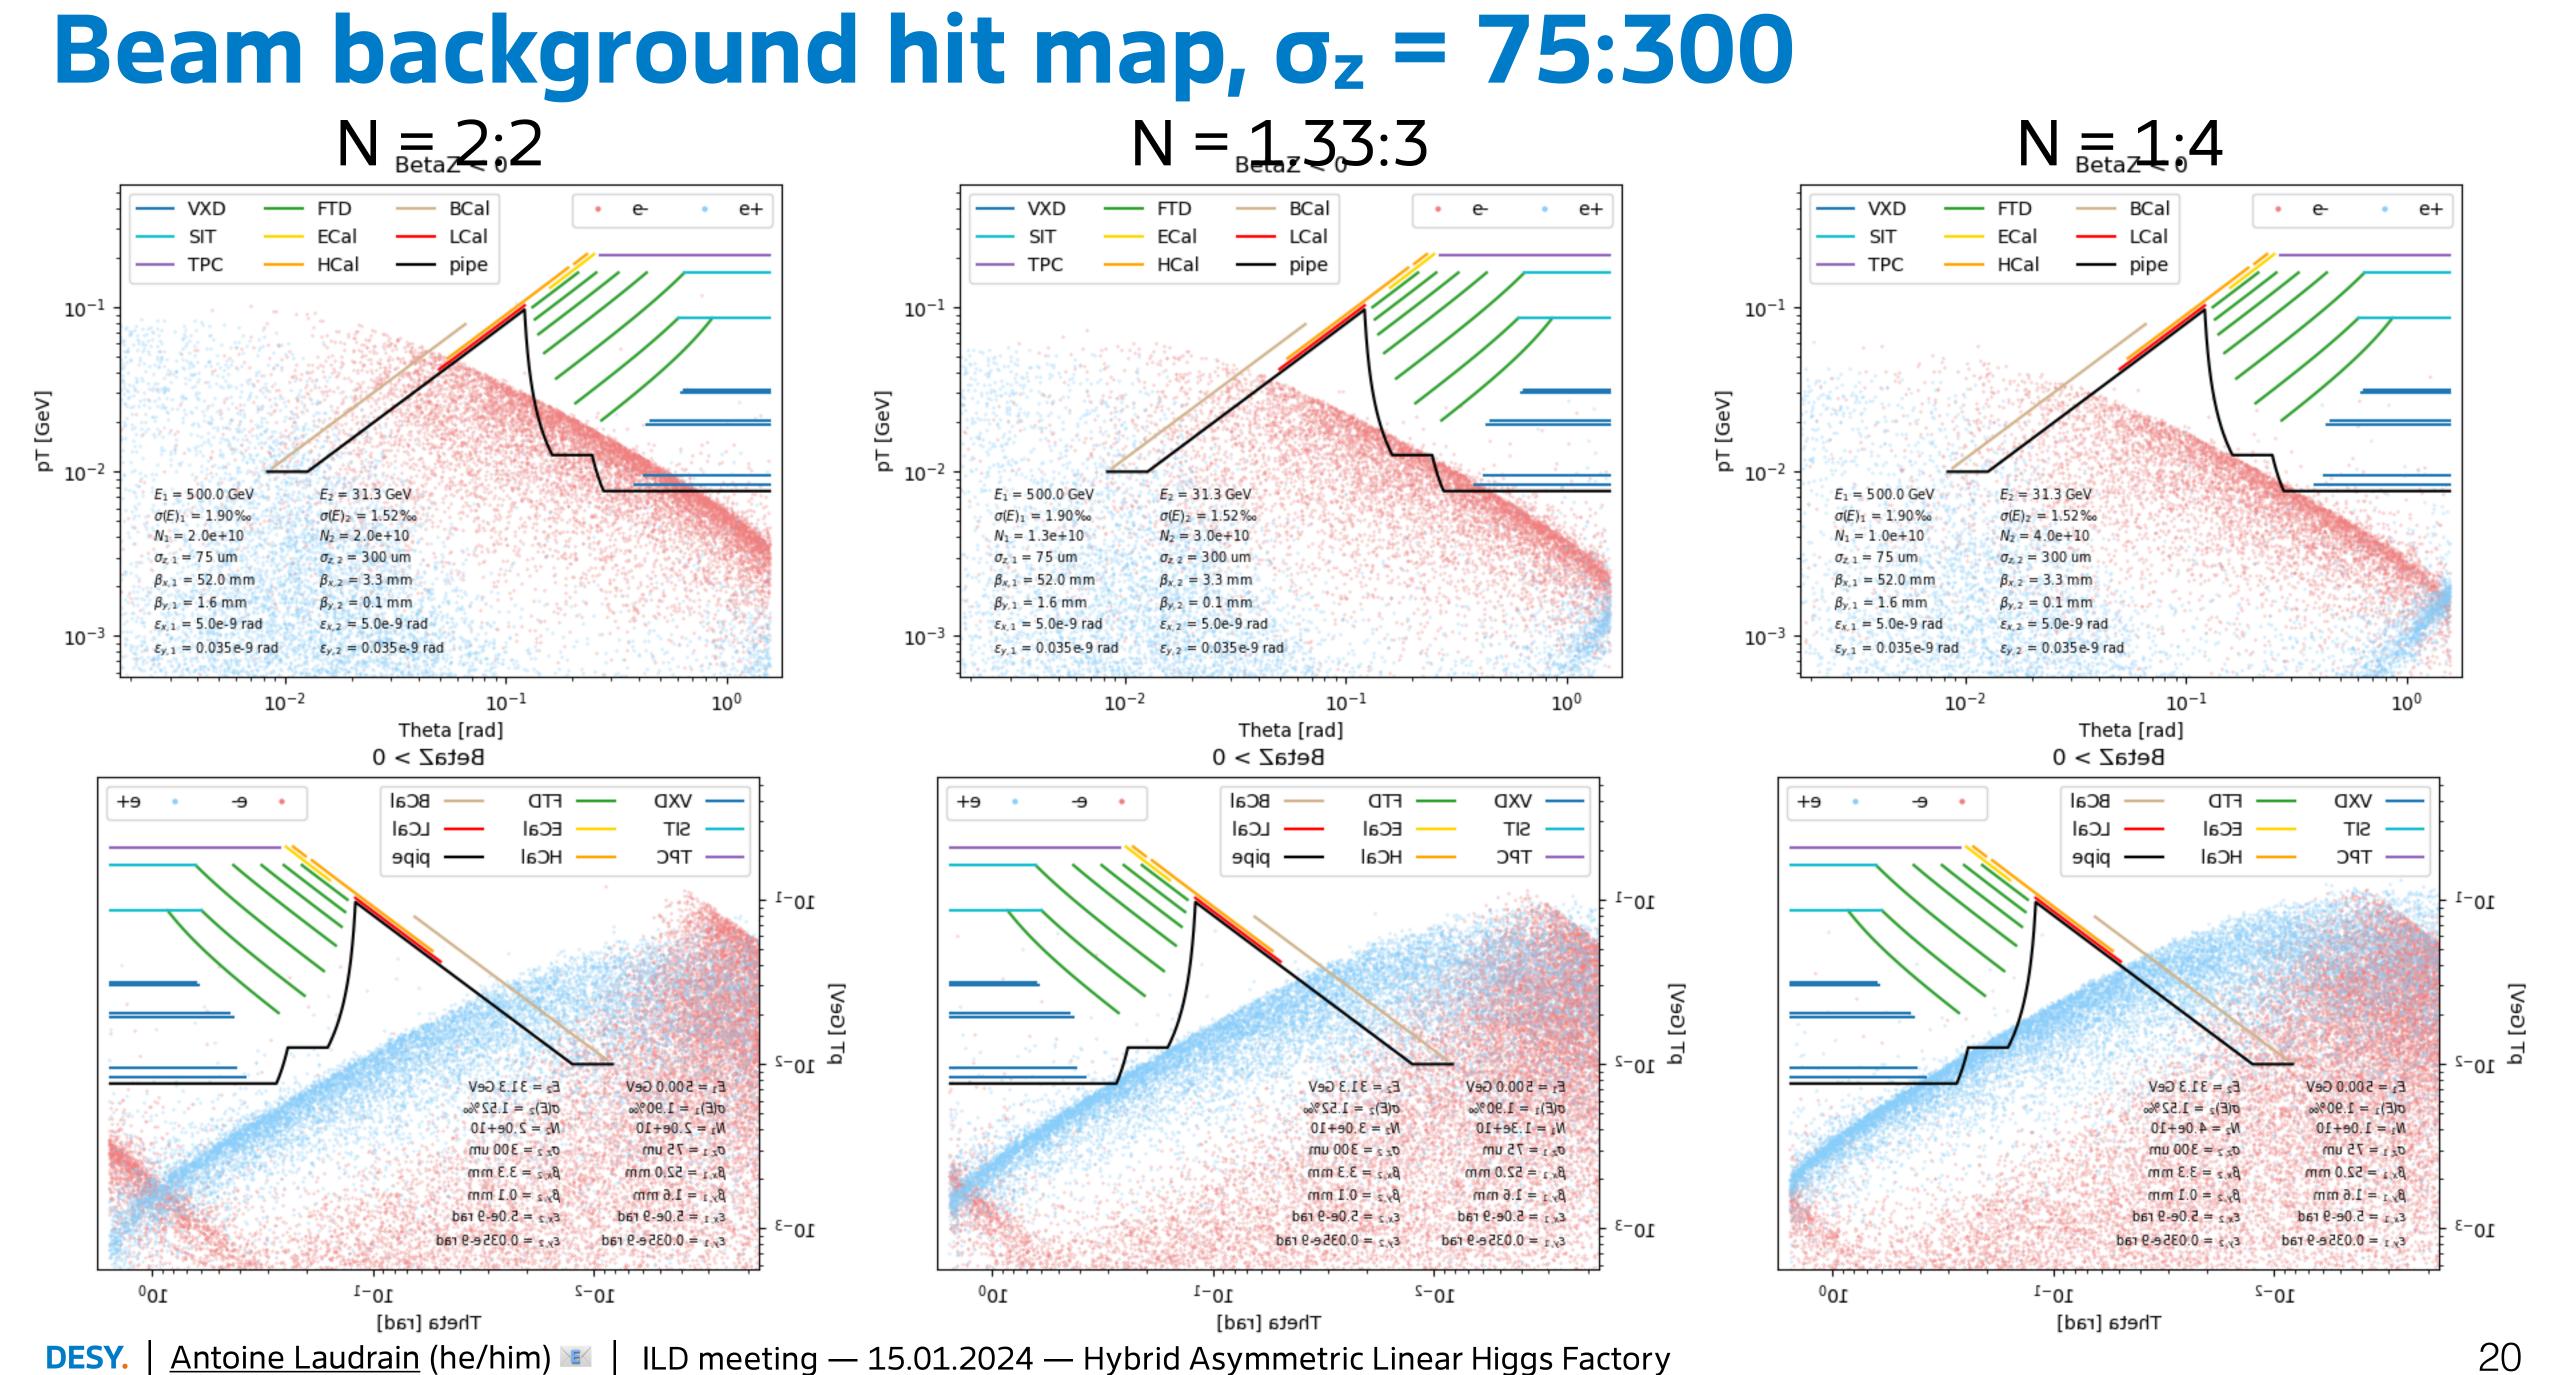

N = 2:2

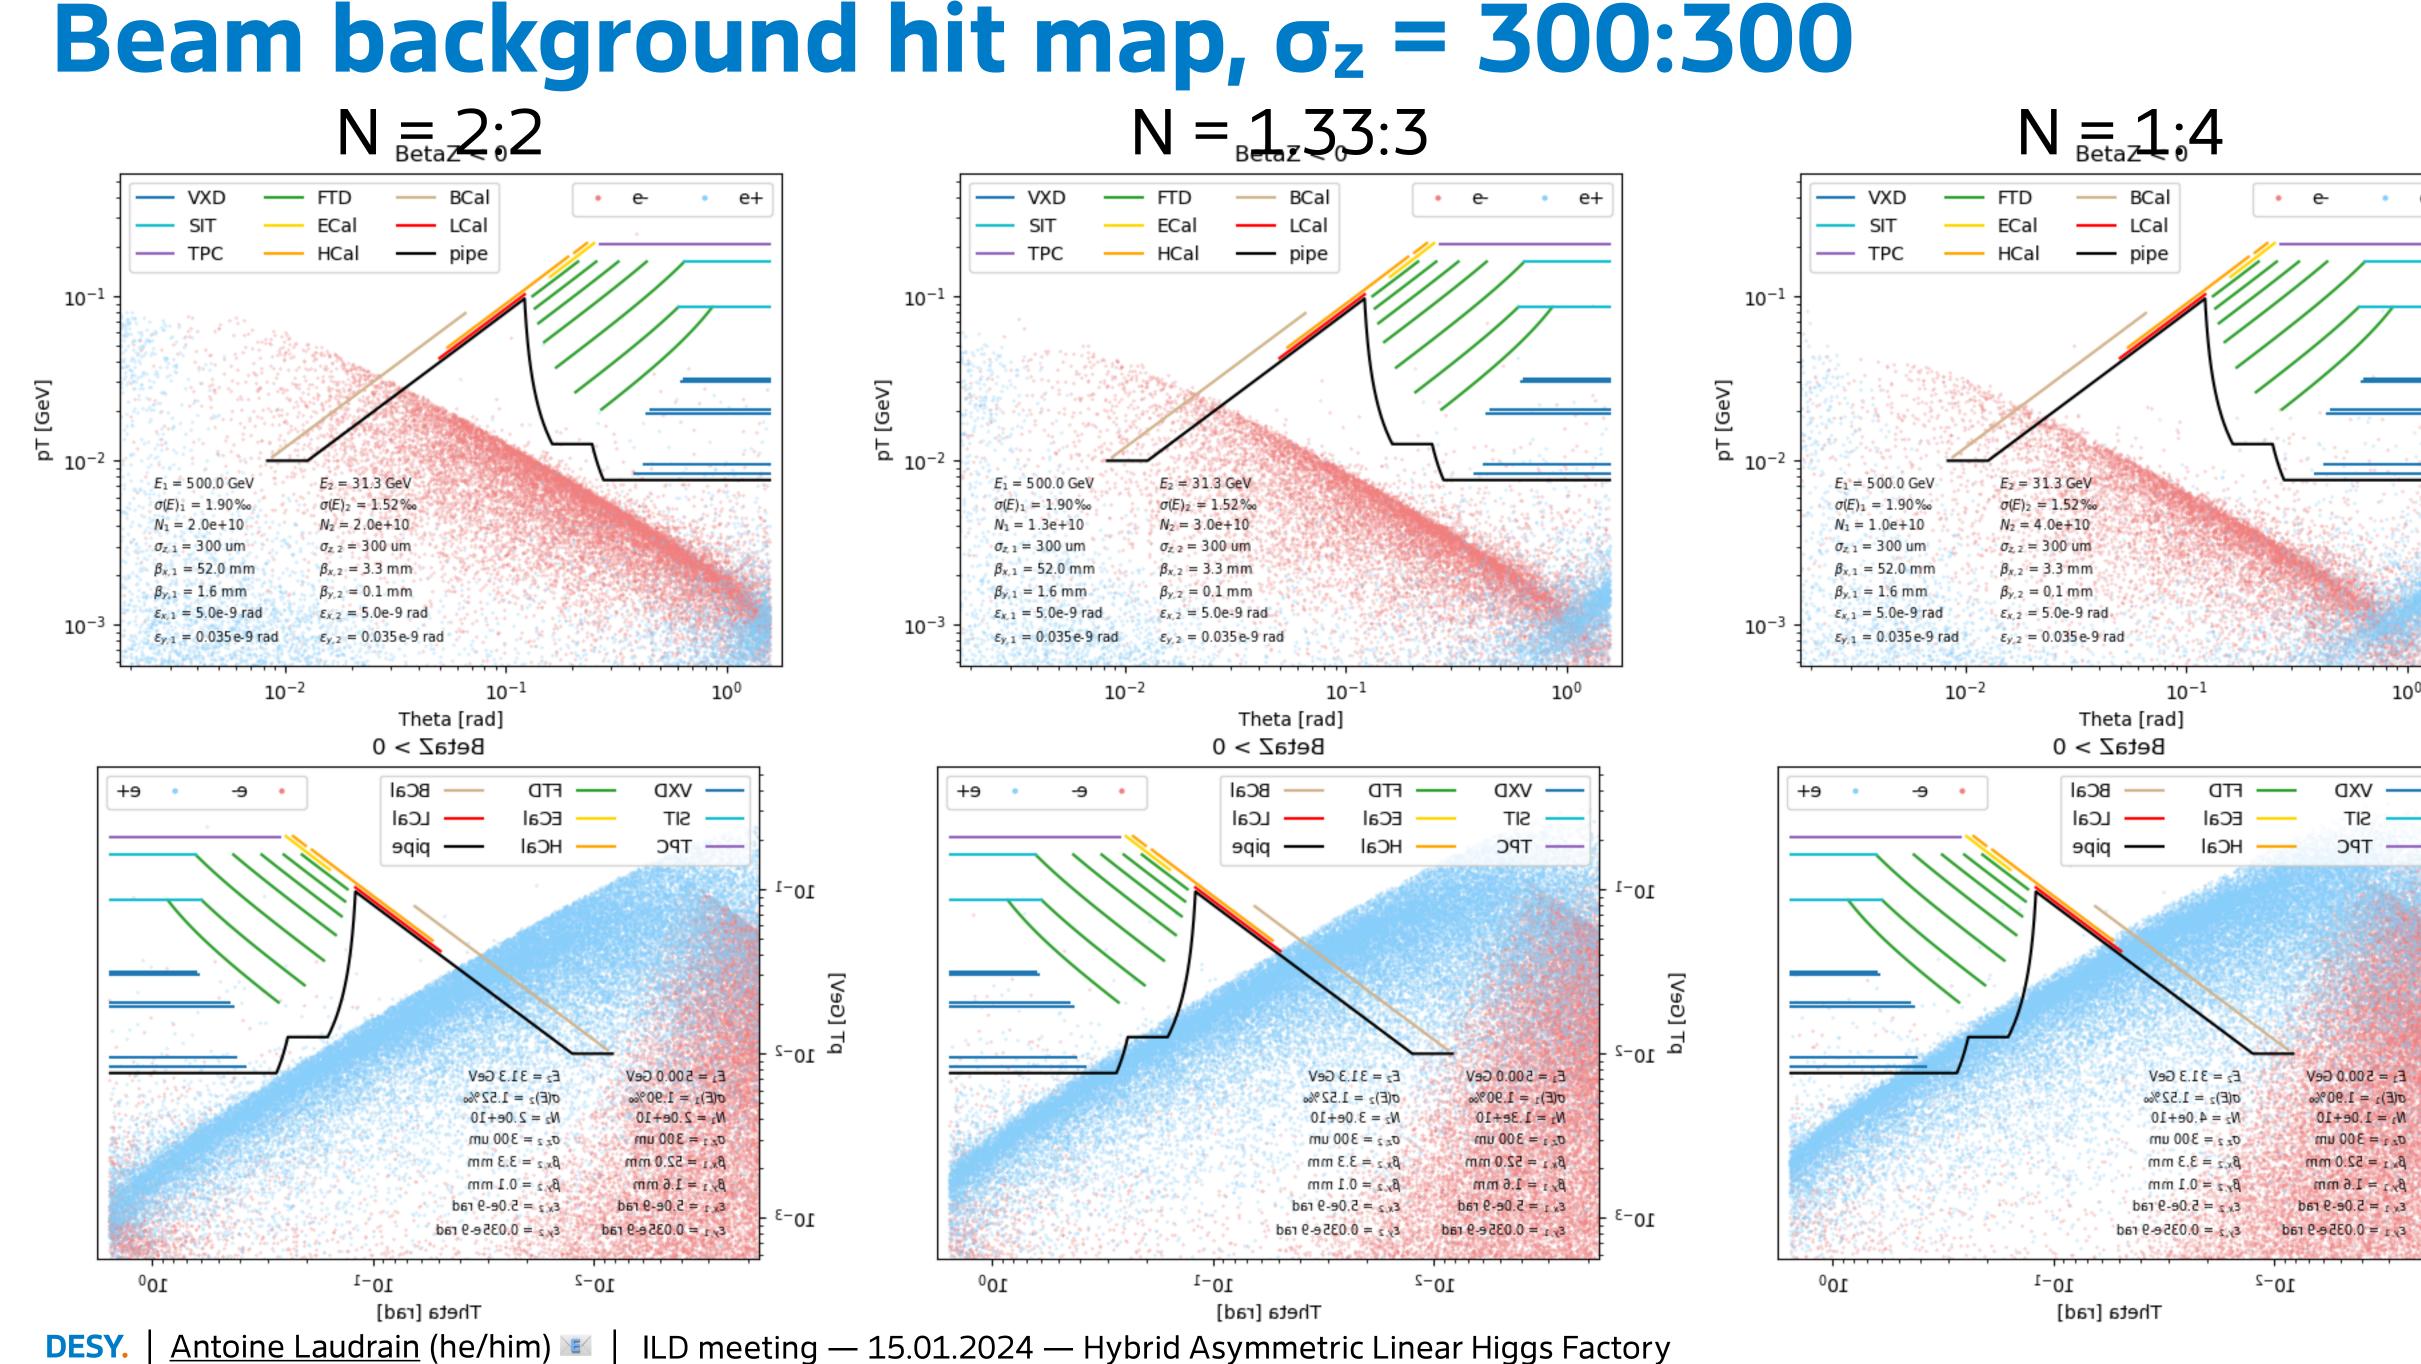

N = 2;2

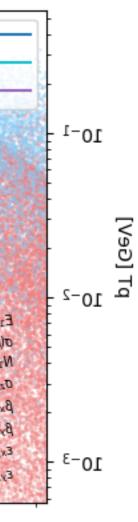

N = 2.2

Impact of beam parameters on luminosity

The price of solving beam backgrounds...

- All points: $E_{-} = 500 \text{ GeV}$, $E_{+} = 31.3 \text{ GeV}$.
- Luminosity computed by Guinea-Pig:
 - Total luminosity
 - Luminosity within 1% of the nominal CM energy ("peak lumi").
