

# Probing $\lambda_{HHH}$ using single-Higgs obs.

— status and plan in ECFA Hself focus topic

Junping Tian (U. Tokyo)

ILD Software & Analysis Meeting, June 5, 2024

(see overview in my talk @ ILD Meeting 2024, Jan. 15-17)

[check out recent mini-workshop on May 15](#)

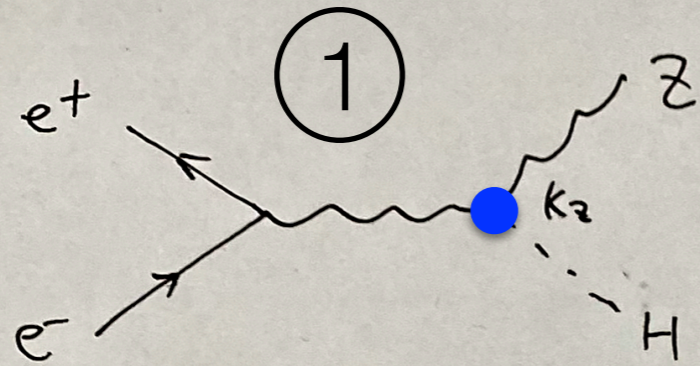

# $\lambda_{HHH}$ : A crucial question by single-Higgs

[Physics Briefing Book]

- note:  $5\sigma$  is potentially reachable at an  $e^+e^- < 500$  GeV
- Would that be a **discovery** of  $\lambda_{HHH}$ ?

# three big hurdles

②

③

# three big hurdles

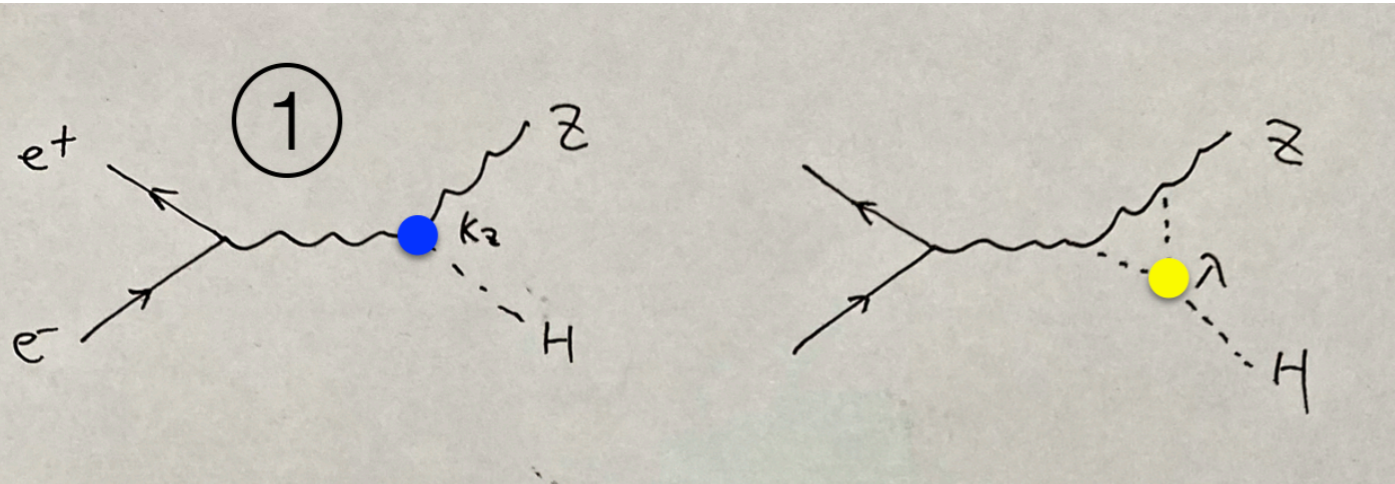

②

③

► cured by LHC top-Yukawa

[Durieux, Gu, Vyronidou, Zhang, '18]

# How to discriminate with HZZ coupling

[McCullough, '13]

$$\delta_{\sigma}^{240} = 100 (2\delta_Z + 0.014\delta_h) \%$$

- $\delta\sigma$  could receive contributions from many other sources
  - >  $\delta h \sim 500\%$  at 250GeV only; [Gu, et al, arXiv:1711.03978]
  - >  $\delta h \sim 50\% + 350/500\text{GeV}$  [Peskin, Yong, JT, paper in preparation]

► “easy” solution: lift degeneracy by multiple  $\sqrt{s}$

# How to discriminate with HZZ coupling

[McCullough, '13]

$$\delta_{\sigma}^{240} = 100 (2\delta_Z + 0.014\delta_h) \%$$

## ► difficult solution: using differential cross section

- effect of  $\lambda$  can be absorbed into anomalous HZZ coupling

$$\mathcal{L} = m_Z^2 \left( \frac{1}{v} + \frac{a}{\Lambda} \right) H Z^\mu Z_\mu + \frac{b}{2\Lambda} H Z^{\mu\nu} Z_{\mu\nu} + \frac{\tilde{b}}{\Lambda} H Z^{\mu\nu} \tilde{Z}_{\mu\nu}$$

- ILD contribution: full analysis of anomalous HVV couplings, by T. Ogawa, paper in preparation (delayed by 3 years mostly due to my schedule)
- ongoing follow-up study by ICEPP Internship student Andrea Maria, scan of multiple  $\sqrt{s}$  around 240, 250, 260 GeV

# How to discriminate with 4-fermion interaction

## ► probably the most pressing

- the effects from (many)  $eett$  operators have not even been calculated
- trying to facilitate both theory & experimental studies
- ILD contribution: estimate  $eett$  sensitivities using  $e+e- \rightarrow tt$  @  $\sim 365$  GeV
- need HL-LHC projection for  $eett$
- could extend previous study to capture the leading effect from RG

[[Jung, Lee, Perello, JT, Vos, '20](#)]
