

ILD models for a circular collider

Daniel Jeans, KEK @ ILD meeting, October 2024

ILD was designed with the ILC in mind

circular Higgs Factory colliders

“same” colliding particles,
“same” physics processes,
same detector ?

major differences:

collision rate

interface to the collider

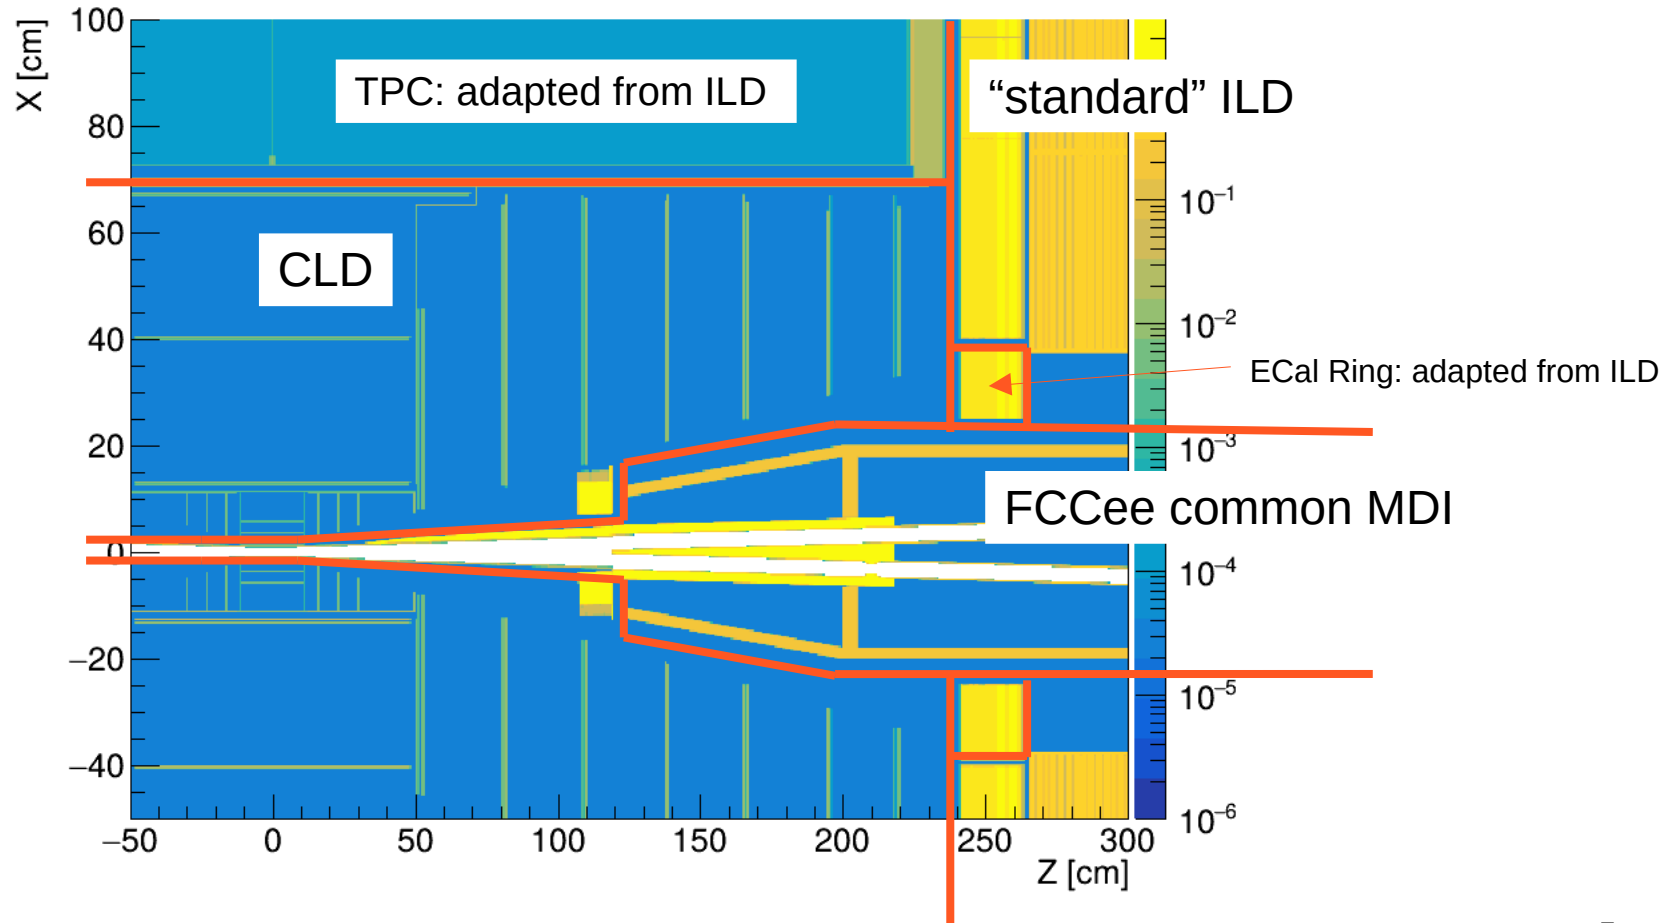

importance of different collision energies

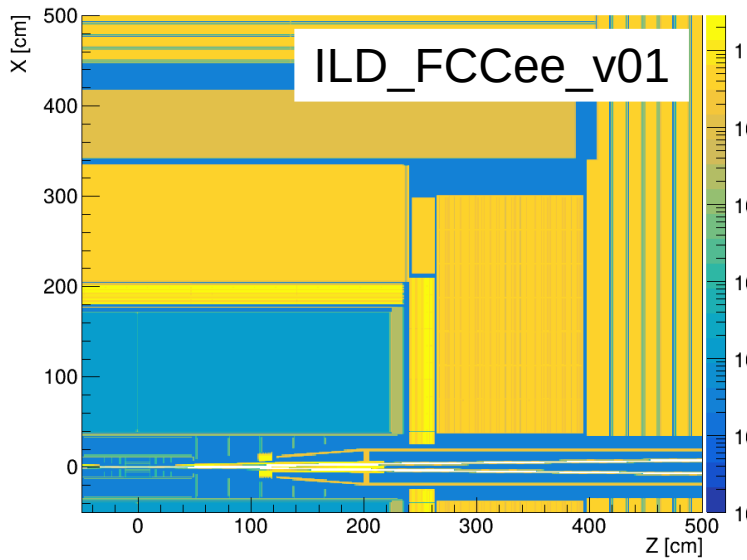

these impose constraints which “ILD for ILC” may not satisfy

	ILC	FCCee
crossing angle	14 mrad	30 mrad
L* [distance from IP to last accel focusing quadupole magnet]	4.1 m	2.0 m
detector solenoid	3.5 T	2.0 T
additional B-fields	anti-DID (?)	- compensating - screening

k4geo : “plug and play”

Work
In
Progress
with
Victor Schwan

TPC (almost)
unchanged

TPC inner radius
increases ~40 cm

CLD
inner tracker
squeezed

CLD
inner tracker
unchanged

better TPC coverage
 → better dEdx

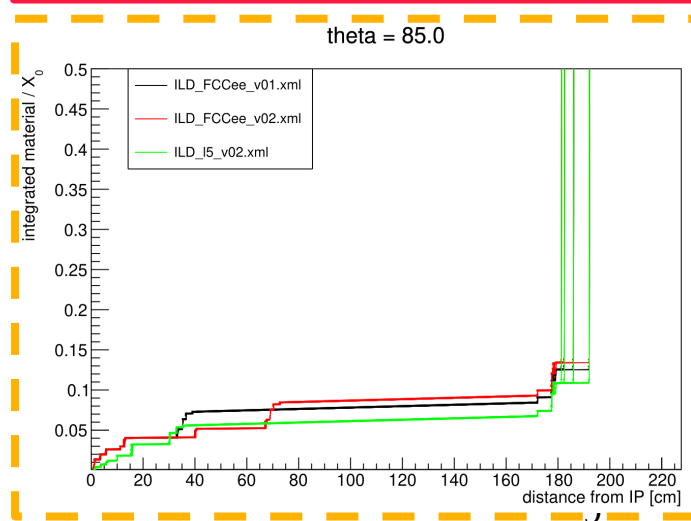

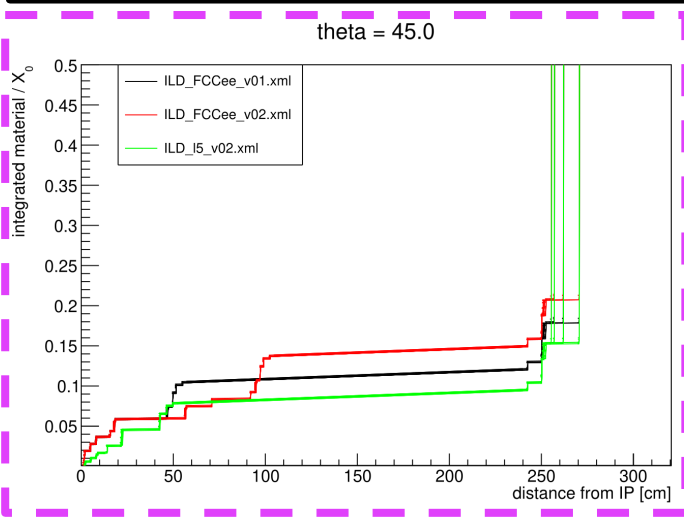

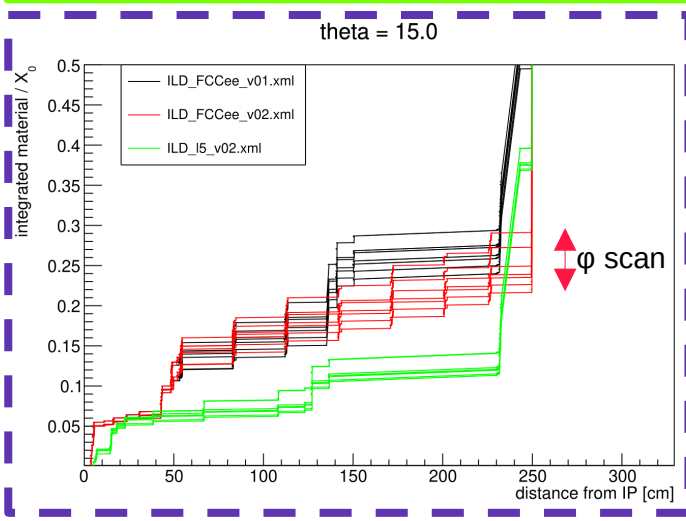

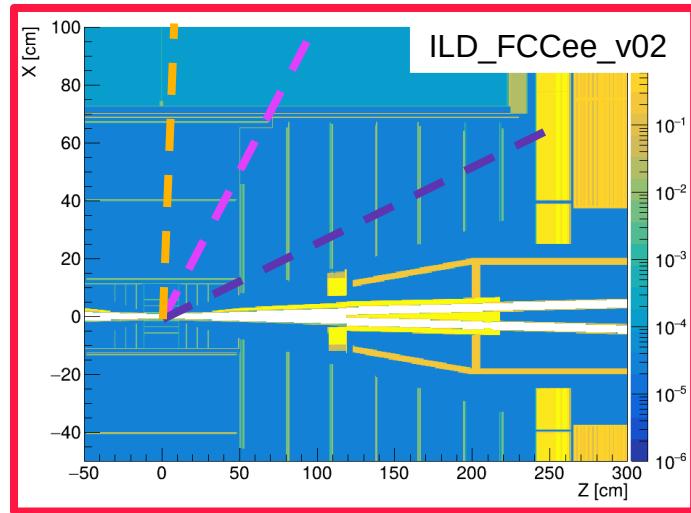

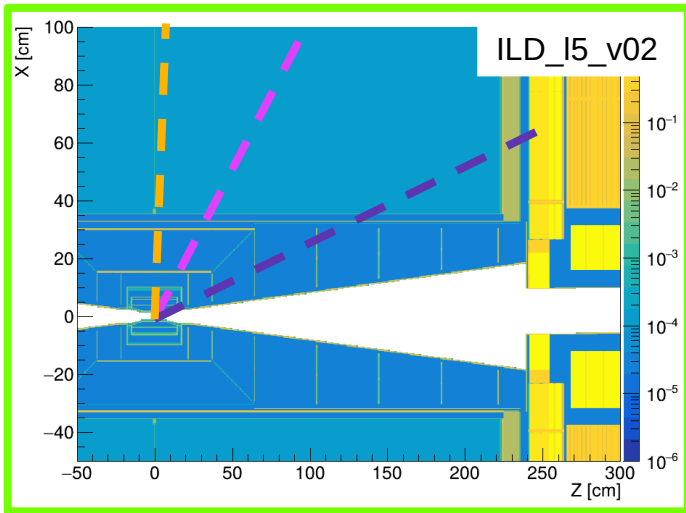

better forward tracking (?)

TPC avoids more severe
 beamsstrahlung bg.
 @ smaller radius

momentum resolution ?

tracking efficiency ? at low pT, with backgrounds ?

material budget

more material in CLD-tracker: effect on momentum resolution, b/c-tagging ?

future improvements for “circular” models

- WIP: get track reconstruction working
now we get separate tracks from the
inner silicon (“Conformal Tracking”) and TPC (“Clupatra”)
need to be combined, + SET, ...
- review of tracker material budget ?
- implement other hardware changes (eg cooling infrastructure)
needed to maintain ILD’s degree of “realism”
- pixel TPC

Summary

propose two ILD variants which would fit at a circular collider

should allow study of the 1st order differences between ILC & FCCee

simulation models have been written

currently labeled “work in progress”

if you are happy with them, we can make them official (ie release into k4geo)

plan to put under k4geo/FCCee/ILD_FCC directory

track reconstruction is being worked on (V. Schwan, T. Madlener, ...)

then need to get PFA working, and extract the usual performance plots.

your contributions, suggestions, comments are highly welcome

backup

new FCCee models			
ILD_FCCee_v01	2.0 (uniform)	FCC-ee	351 ± 115
ILD_FCCee_v01	2.0 (map)	FCC-ee	261 ± 86
ILD_FCCee_v01	2.0 (map), no mask	FCC-ee	707 ± 116
ILD_FCCee_v01	2.0 (map), no mask HOM	FCC-ee	536 ± 114

- many TPC hits induced by beamstrahlung interactions with shielding
- if we remove the shielding, they just interact elsewhere: actually *increases* TPC backgrounds
- limited scope to reduce MDI-related backgrounds?
any ideas out there?
