Summary

- o G11 tubes
 - specifications
 - measurement
- o Aluminum and steel disks and rings
 - specifications
 - measurement
- o Calculation of interference
- o Preparation for the assembly at LASA
 - other needed parts
 - assembly kit
 - tests

G11 tubes - specifications

FNAL required specifications

Material:

Filament wound in epoxy matrix

Geometry:

Int_diam = 295.58 ± 0.05

Ext_diam = 300.00 ± 0.05

Thickness = 2.21 ± 0.05

G11 tubes - specifications

Upper tube: American - Lower tube: Danish

G11 tubes - measurement

Tubes measurement

OMCM company performed a measurement of the 24 US tubes and the Danish one.

Measured dimensions: internal and external diameter

Temperature: 20°C

Procedure: the machine measures 8 points along the internal circumference, 8 points along the external circumference and calculate the mean internal diameter (D_i) and the mean external diameter (D_e)

G11 tubes - measurement

Measure of the top of the tube				
tube n.	diam_ext	out of range	diam_int	out of range
51	300.037		295.754	0.12

G11 tubes - measurement

o Results

- Internal diameter out of range: 47 / 50 measures
- External diameter out of range: 21 / 50 measures
- Thickness out of range: 21 / 50 measures
- Danish tube similar to US one

Al and steel parts - specification

FNAL required specifications

Materials:

Steel AISI 304

Aluminum 6061 T6

Geometry:

Rings Int_diam = 295.58 ± 0.05

Disks Ext_diam = 300.00 ± 0.05

Al and steel parts - measurement

Al and steel parts measurement

OMCM company performed a measurement of 6 sets of disks and rings.

Measured dimensions: internal rings diameter and external disks diameter

Temperature: 20°C

Procedure: the machine measures 16 points along the internal circumference of the ring, 16 points along the external circumference of the disk and calculate the mean internal diameter of the ring and the mean external diameter of the disk.

Al and steel parts - measurement

Results 1/2

Position 1: steel disks 1.8K

disk n.	Mean_diam	out of tolerance
9	296.025	
10	296.015	
23	296.007	-0.003

26	299.966	-0.004
27	299.993	

Interference

Calculation of interference between:

- empty space between disk and ring
- G11 tube thickness

Post assembly

- o The assembly of first 6 posts will be performed at LASA in next months;
- o Superinsulation: 10 and 20 layers respectively between 5K to 70K disks and 70K to 300K disks;
- o The assembly kit was produced by Zanon, it's now at LASA;
- o Tests: every post will be tested at 5000 kg.

Post assembly
