

Top Mass from Jet Distributions

Sonny Mantry
University of Wisconsin at Madison

International Linear Collider Workshop
University of Illinois at Chicago, Nov. 17th, 2008

Motivation

- Top quark couples strongly to the Higgs sector and a good probe of new physics.
- The top mass is the dominant source of theoretical uncertainty in EWPOs.
- Typically the uncertainty in the extracted Higgs mass will be limited by the uncertainty in the top mass.
$$\delta m_t \sim \delta m_h.$$
- Good reasons to measure the top mass with high precision.

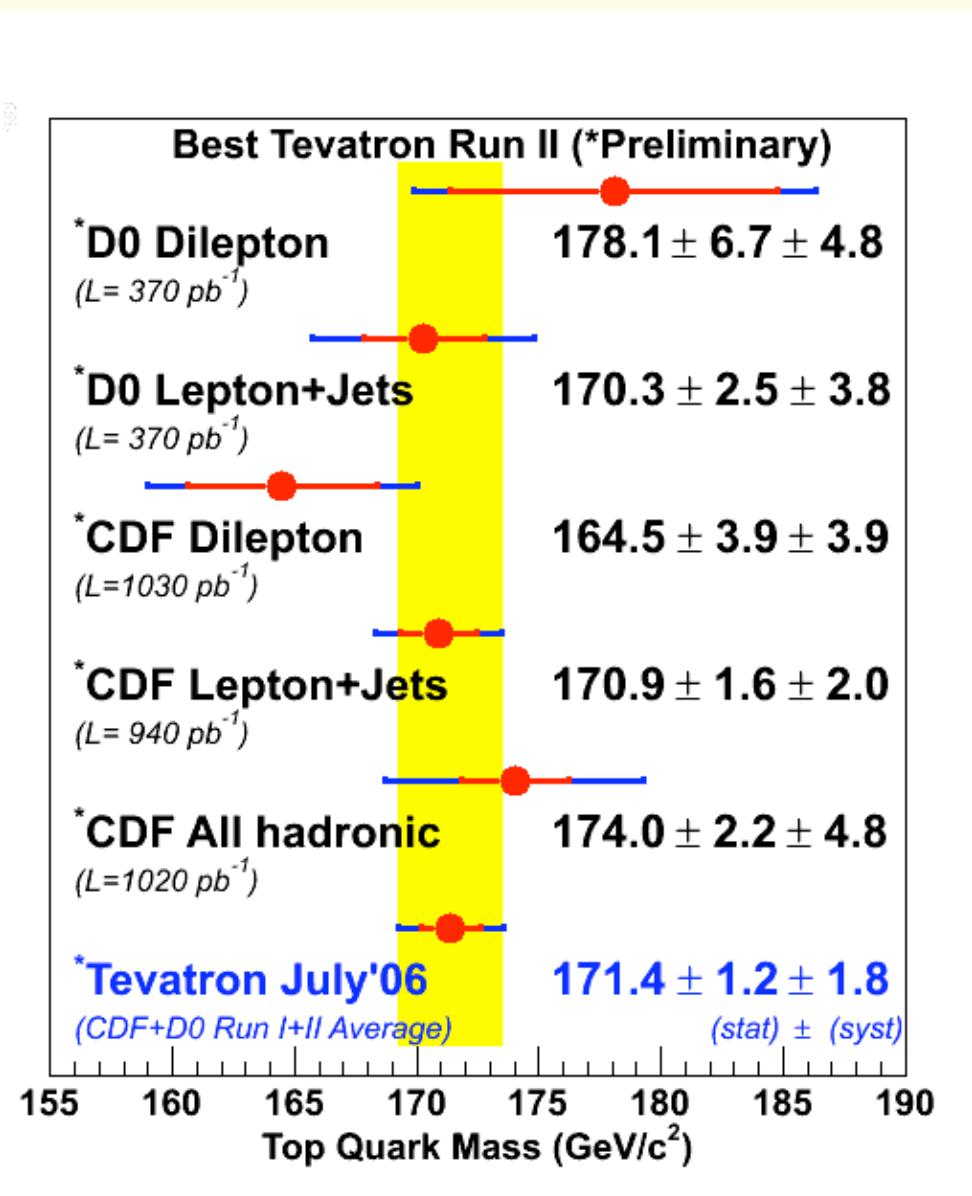

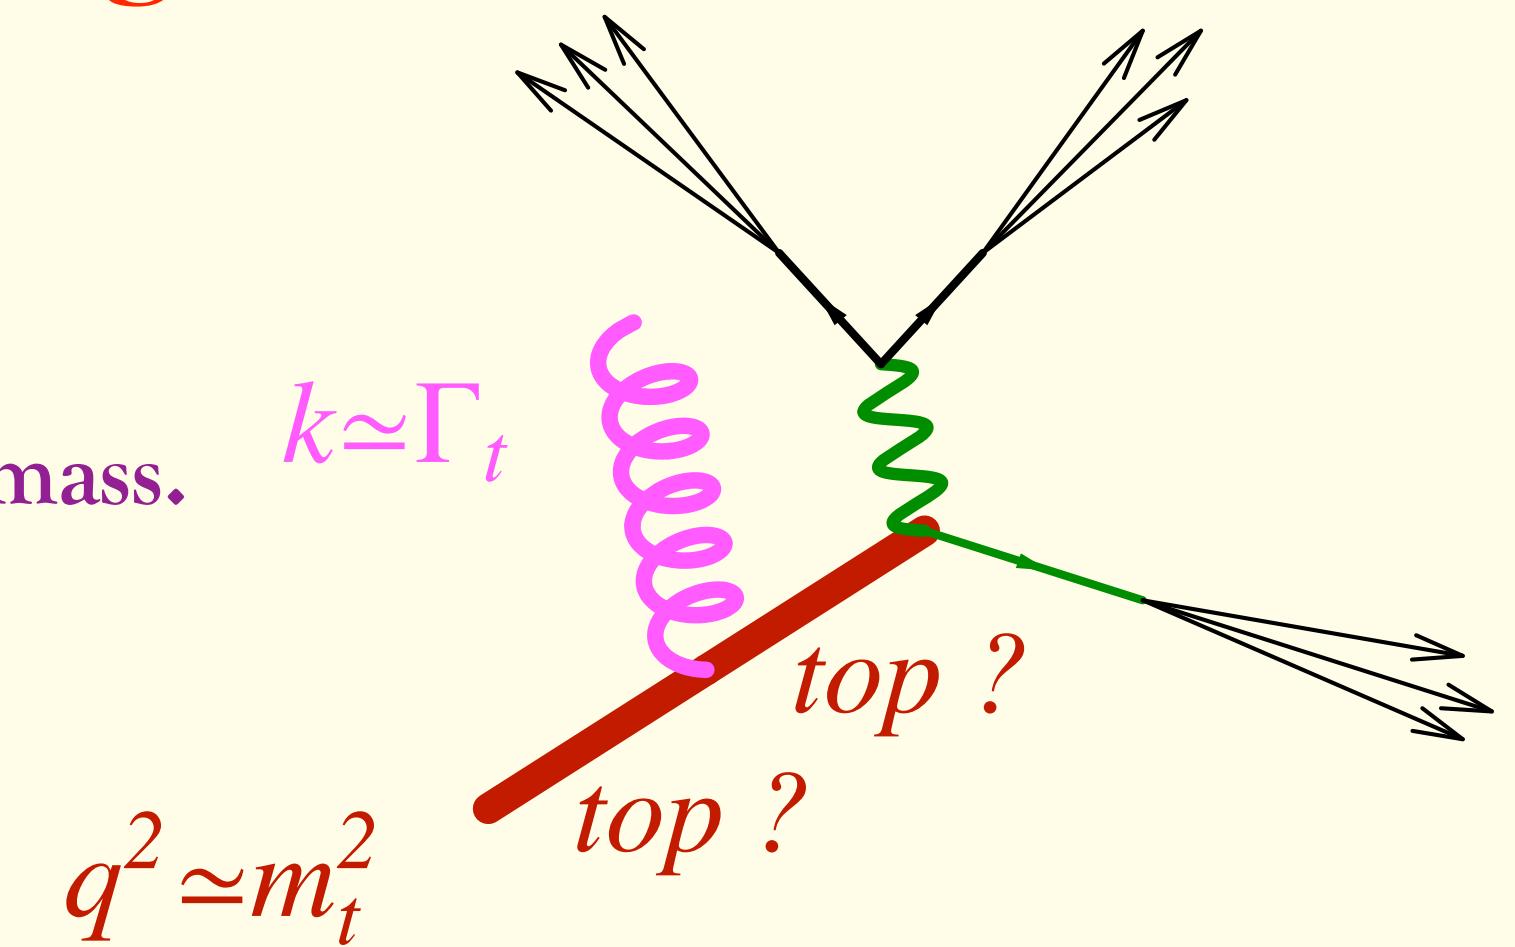

Predictions for the W and top mass in the SM & MSSM

What are we Measuring?

- What is the top mass?

- Top is a colored parton. Cannot define physical on-shell mass.
- Top mass is a parameter of the Lagrangian.
- Top mass parameter is scheme dependent.

- Which top mass?

- Which mass are the experimentalists measuring?
- Pole mass? : $\delta m \sim \Lambda_{\text{QCD}}$ renormalon ambiguity, poor perturbative behavior.
- For better precision we need a short distance top mass.
- How can we extract a short distance mass? Which mass?

Current Top Mass Measurement:

$$M_t = 170.9 \pm 1.1(\text{stat}) \pm 1.5(\text{syst}) \text{ GeV}/c^2 \text{ (CDF/D0)}$$

Threshold Scan

(Fadin & Khoze; Peskin & Strassler; Hoang, Manohar, Stewart, Teubner,...)

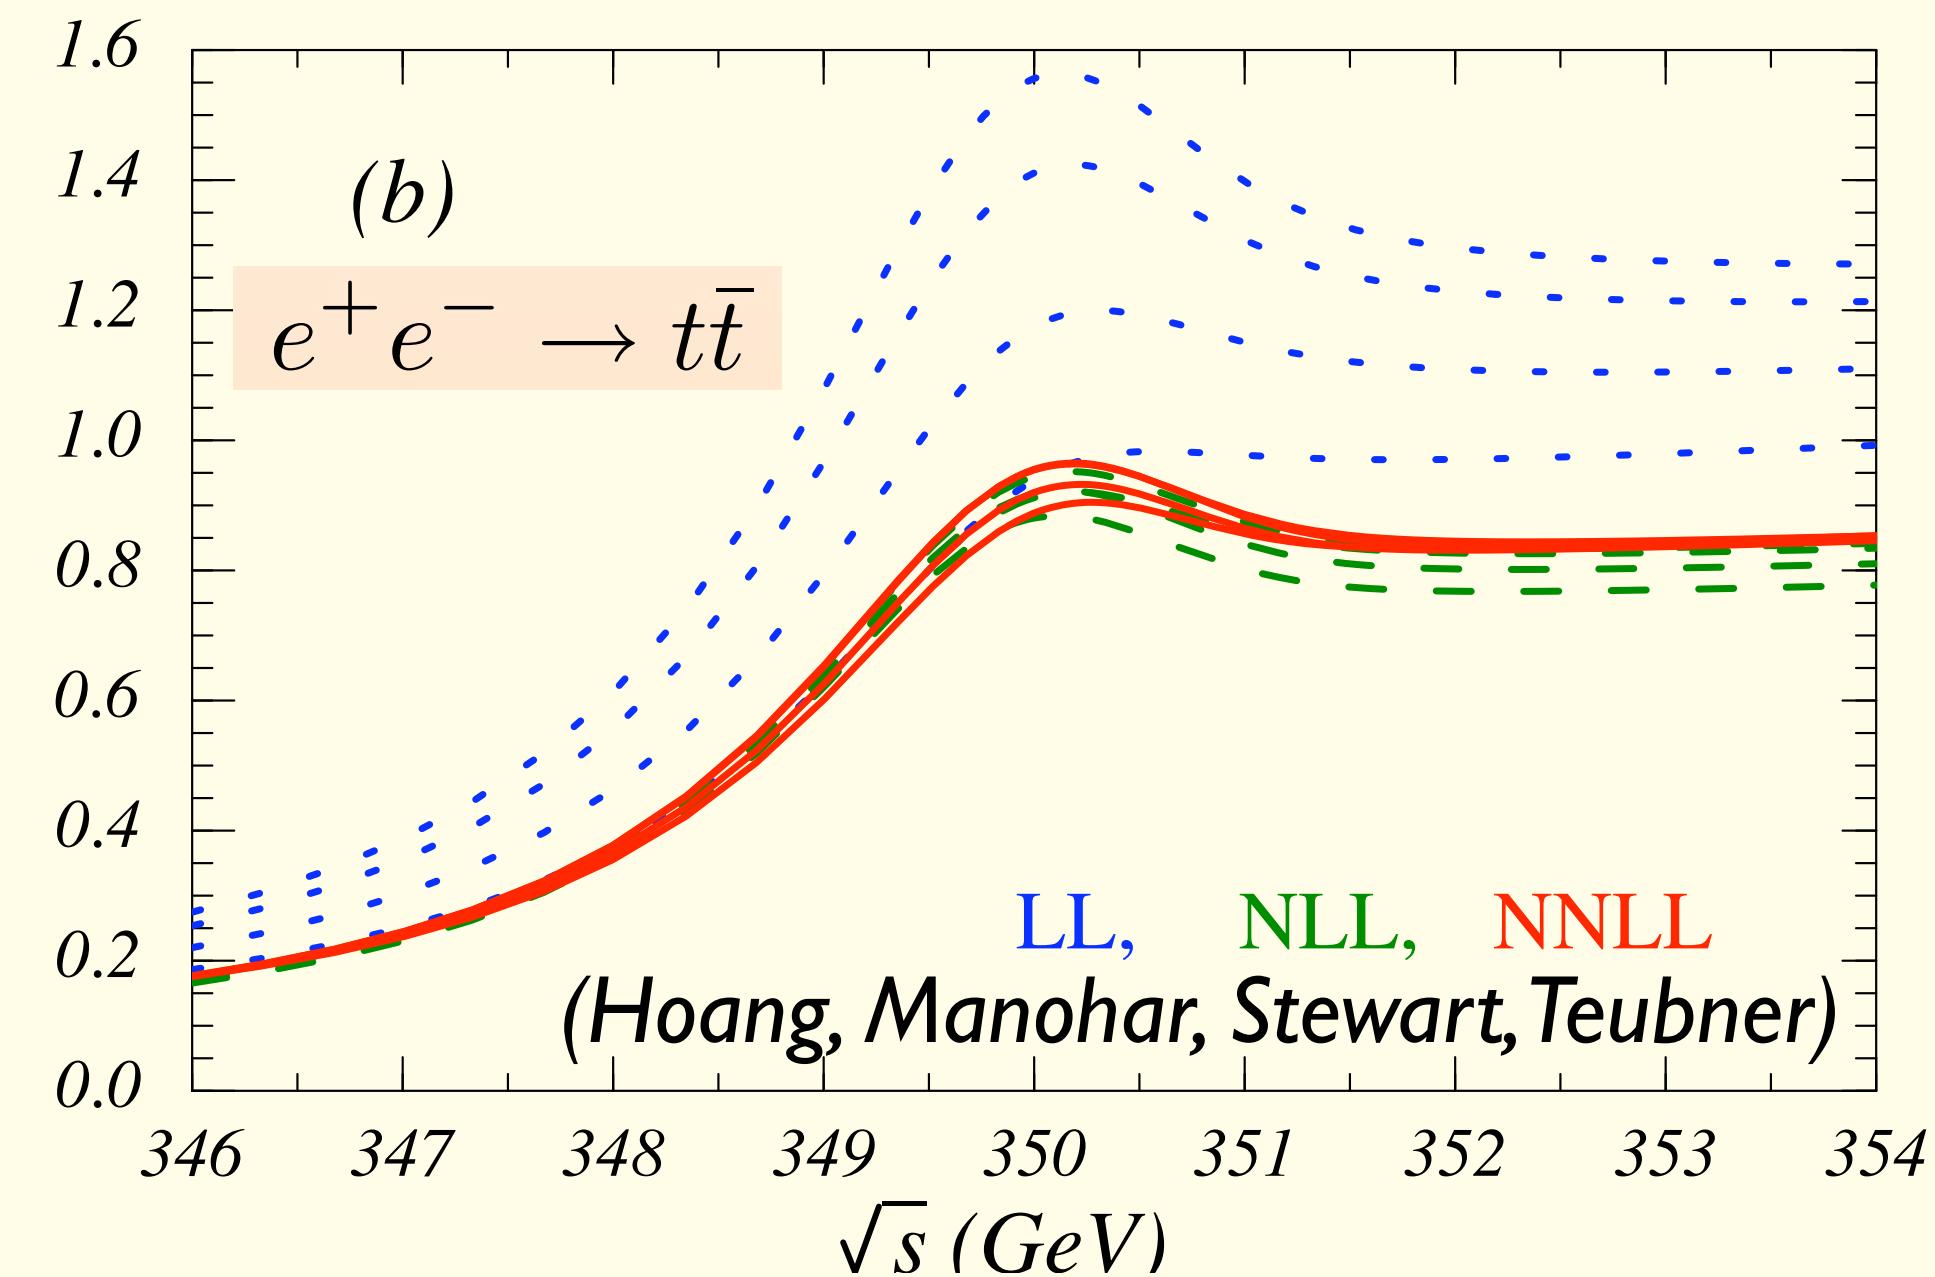

- Top pair production in the threshold region

- Shape of total cross-section sensitive to top mass.
- Top width provides IR cutoff.
- Non-perturbative effects are small.

- Physics well understood

- NRQCD is the appropriate EFT.
- Well defined relation to short distance mass. eg. 1S mass
- NNLL results known.
- Theoretical uncertainty:

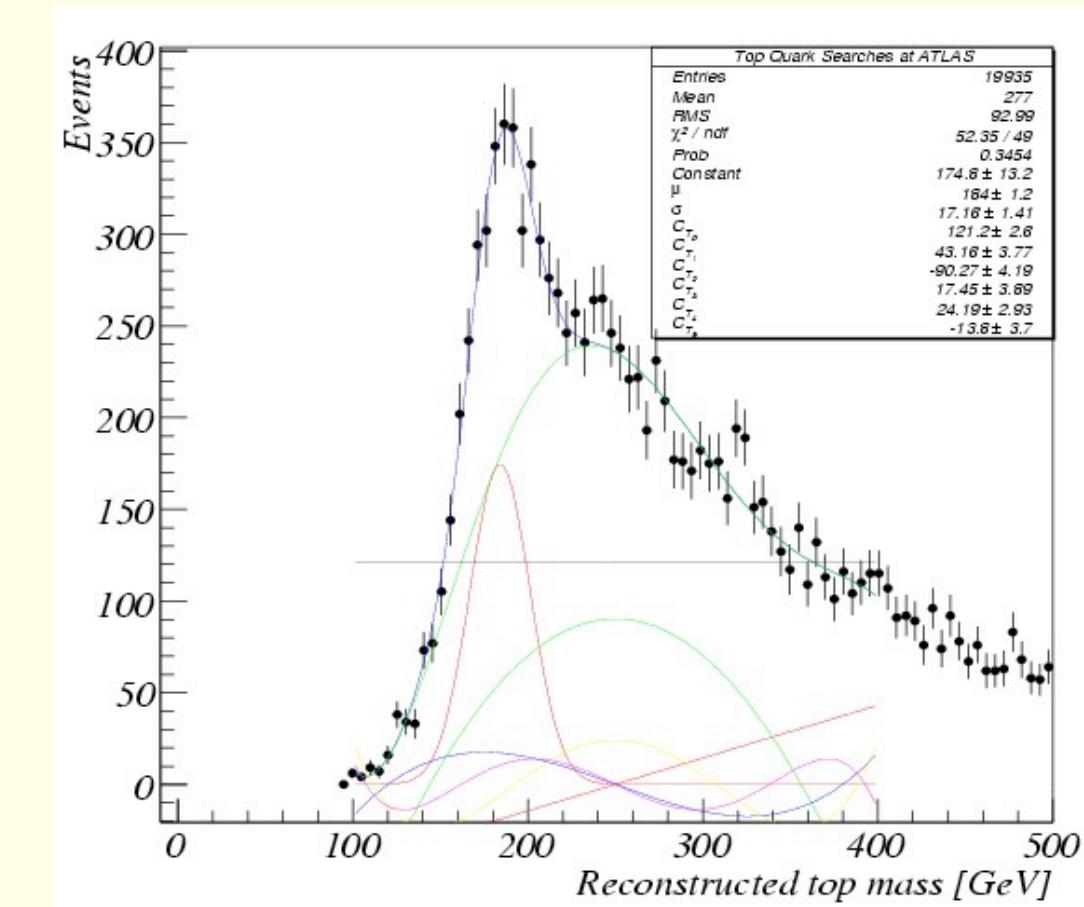

$$\delta m_t^{th} \sim 100 MeV$$

Jet Reconstruction

- Jet reconstruction methods not so well understood

- Suitable observables with a well defined relation to a short distance mass ★
- Summation of large logarithms ★
- Final state radiation ★
- Initial state radiation
- PDFs
- Jet Energy scale ★
- Beam remnants
- ...

★ Issues common to
the ILC & LHC

- We study high energy top pair production at the linear collider

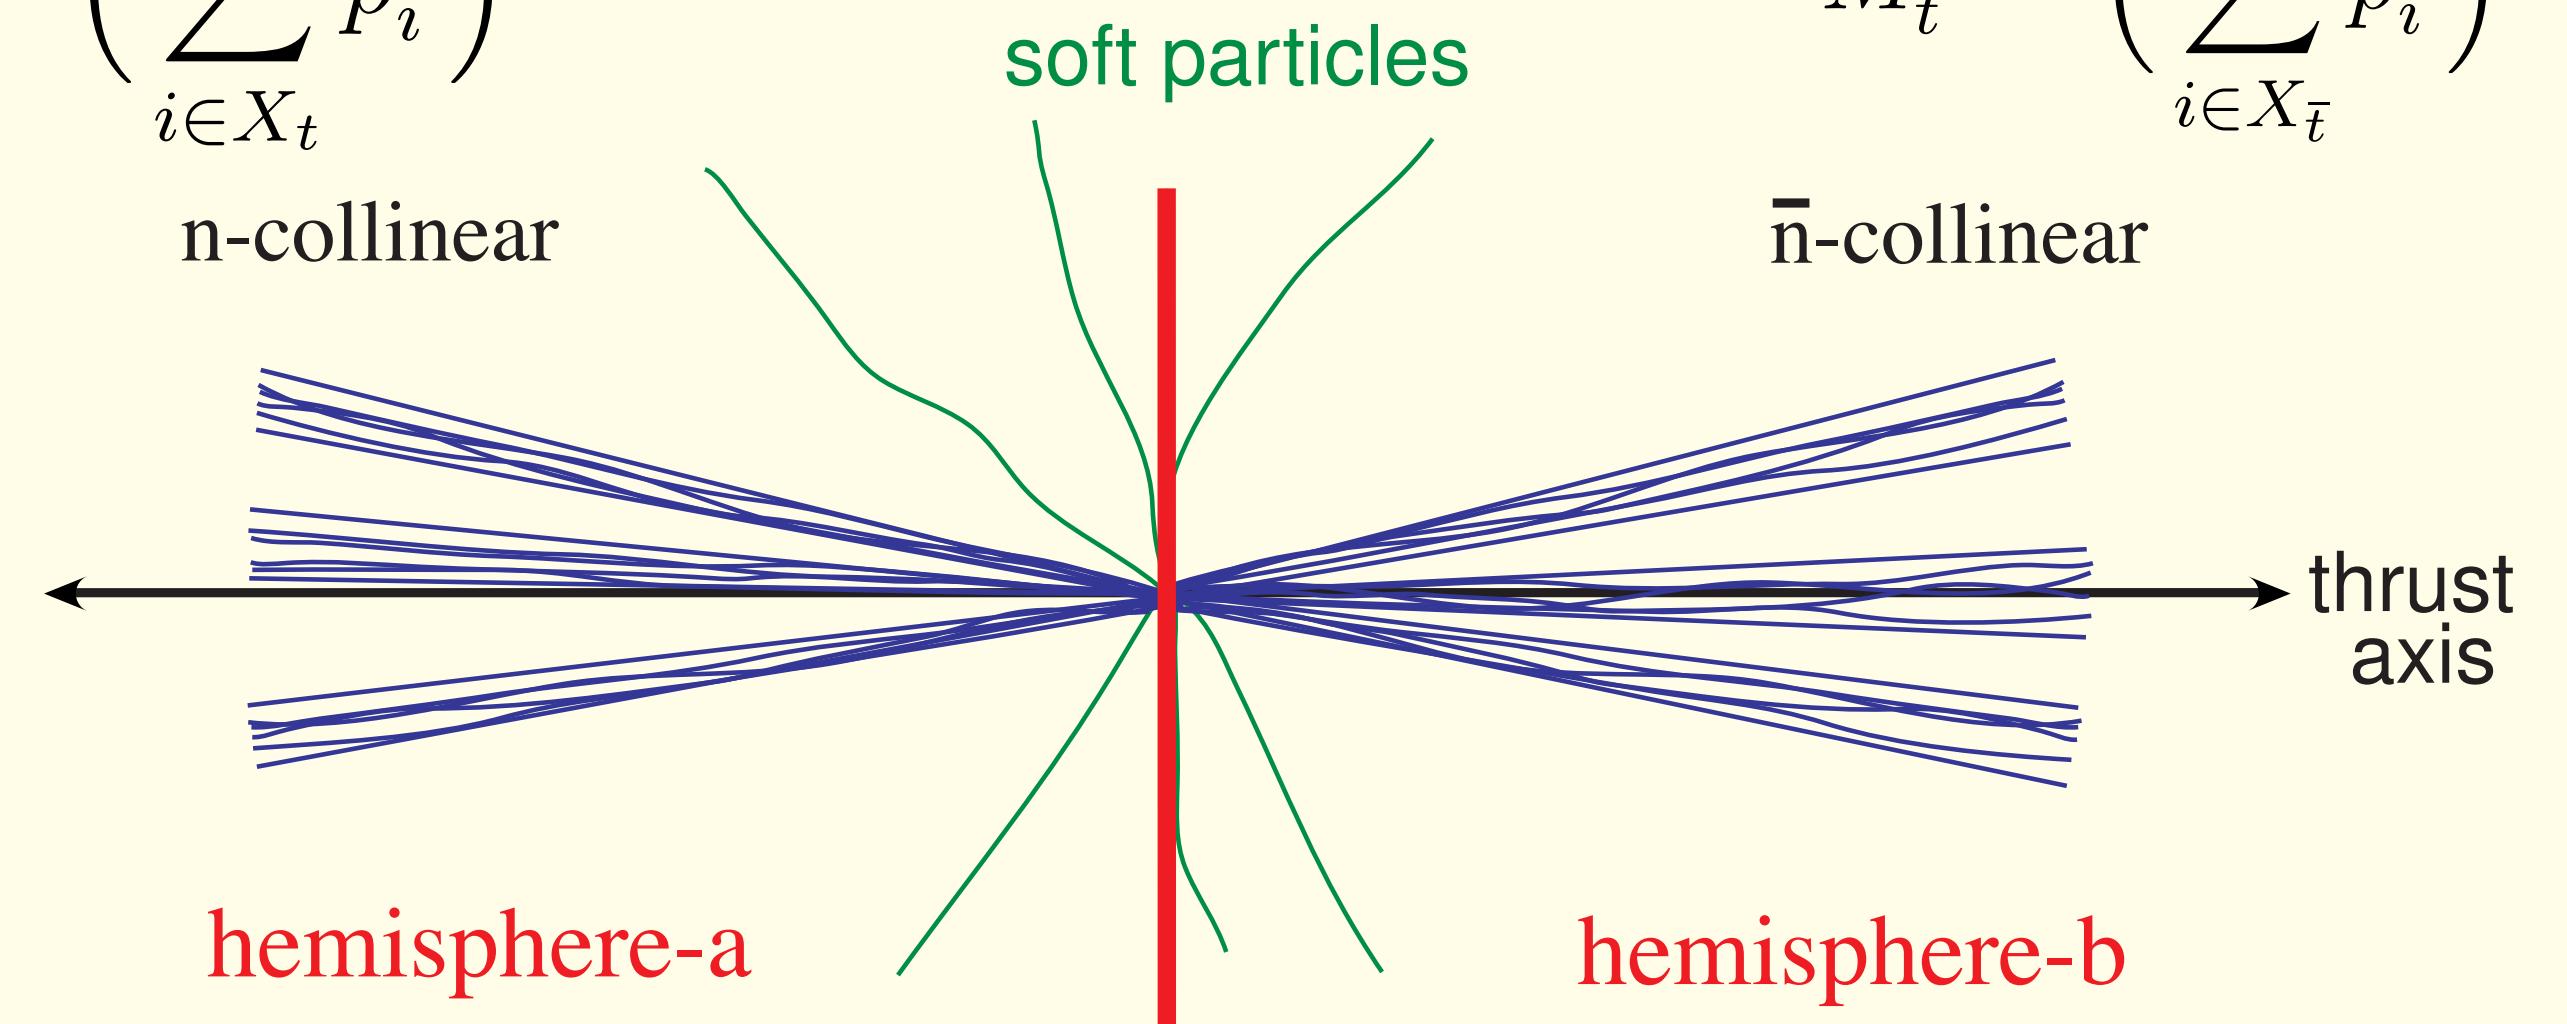

$$e^+ e^- \rightarrow t\bar{t}X, \quad Q \gg m \gg \Gamma > \Lambda_{QCD}$$

Linear Collider Observable

- Hemisphere invariant mass distribution of top jets:

$$\left(\frac{d\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}}$$

$$M_t^2 = \left(\sum_{i \in X_t} p_i^\mu \right)^2$$

- Peak Region

$$\hat{s}_{t,\bar{t}} \equiv \frac{s_{t,\bar{t}}}{m} \equiv \frac{M_{t,\bar{t}}^2 - m^2}{m} \sim \Gamma \ll m$$

Relevant Energy Scales

- Center of mass energy

$$Q \sim 1\text{TeV}$$

- Top quark mass

$$m \sim 174\text{GeV}$$

- Top quark width

$$\Gamma \sim 2\text{GeV}$$

- Confinement Scale

$$\Lambda \sim 500\text{MeV}$$

Disparate energy scales

Effective Field Theory!

Effective Field Theories

Kinematics for Top Jets: I

- **High Energy Condition:** Top quark pairs are produced with a center of mass energy much larger than the top mass

$$Q \gg m$$

- In this limit one can treat top quarks as collinear degrees of freedom in the **Soft Collinear Effective Theory (SCET)** (*Bauer, Fleming, Luke, Pirjol, Stewart*).

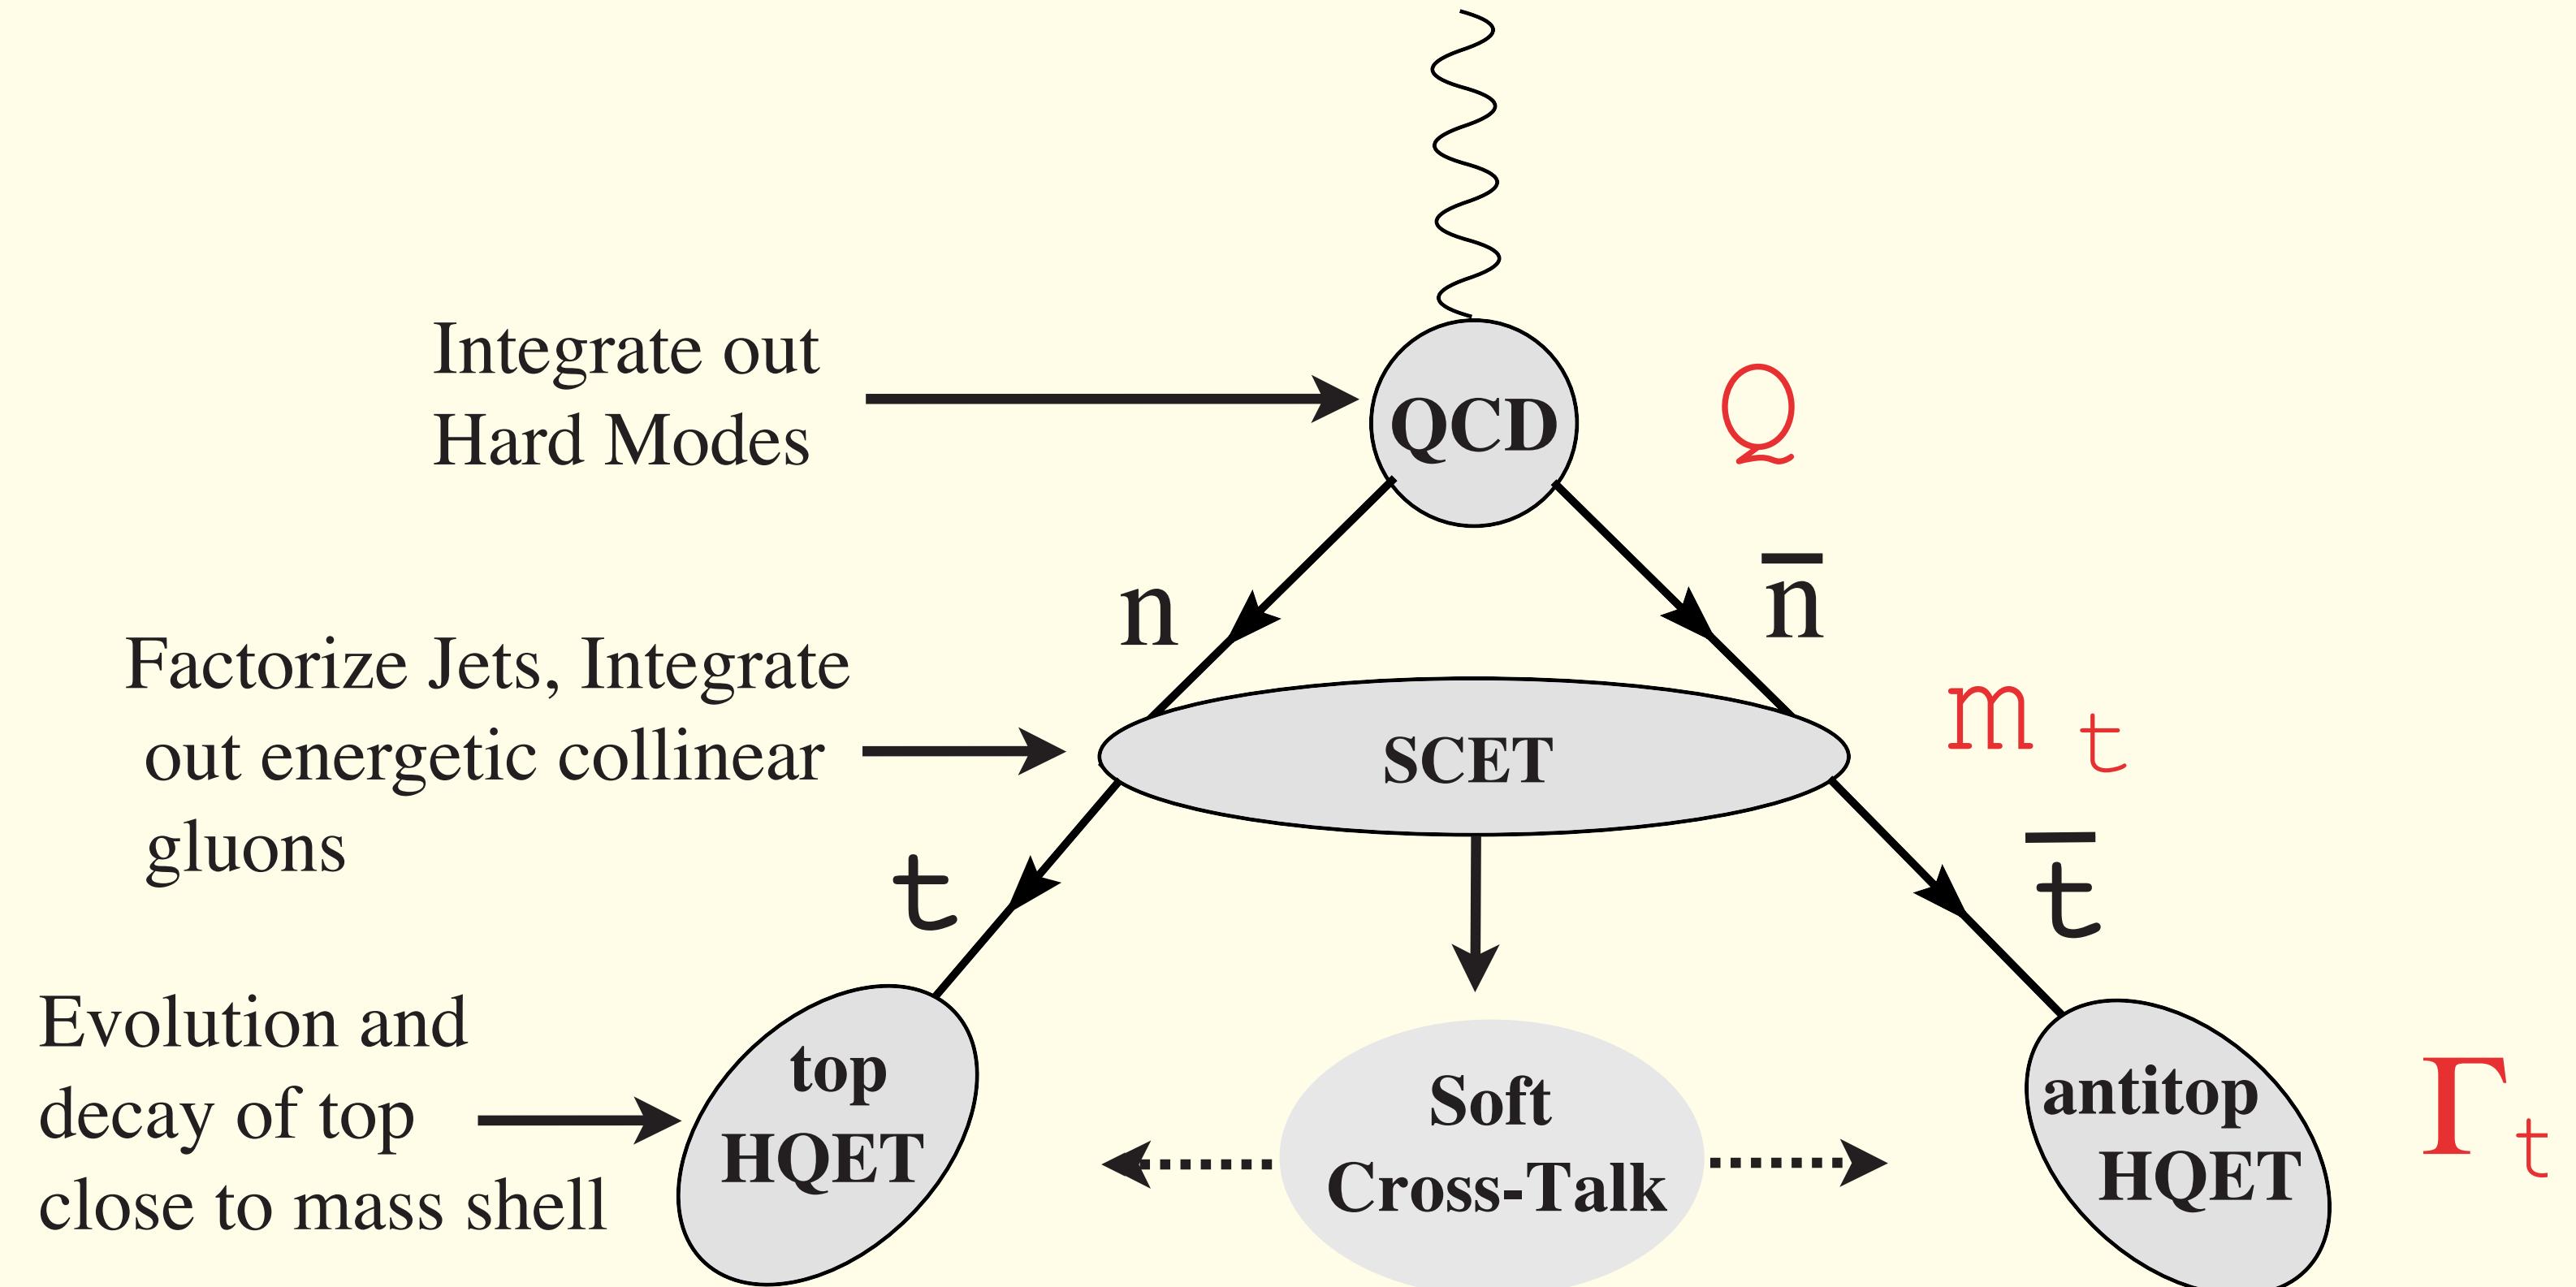

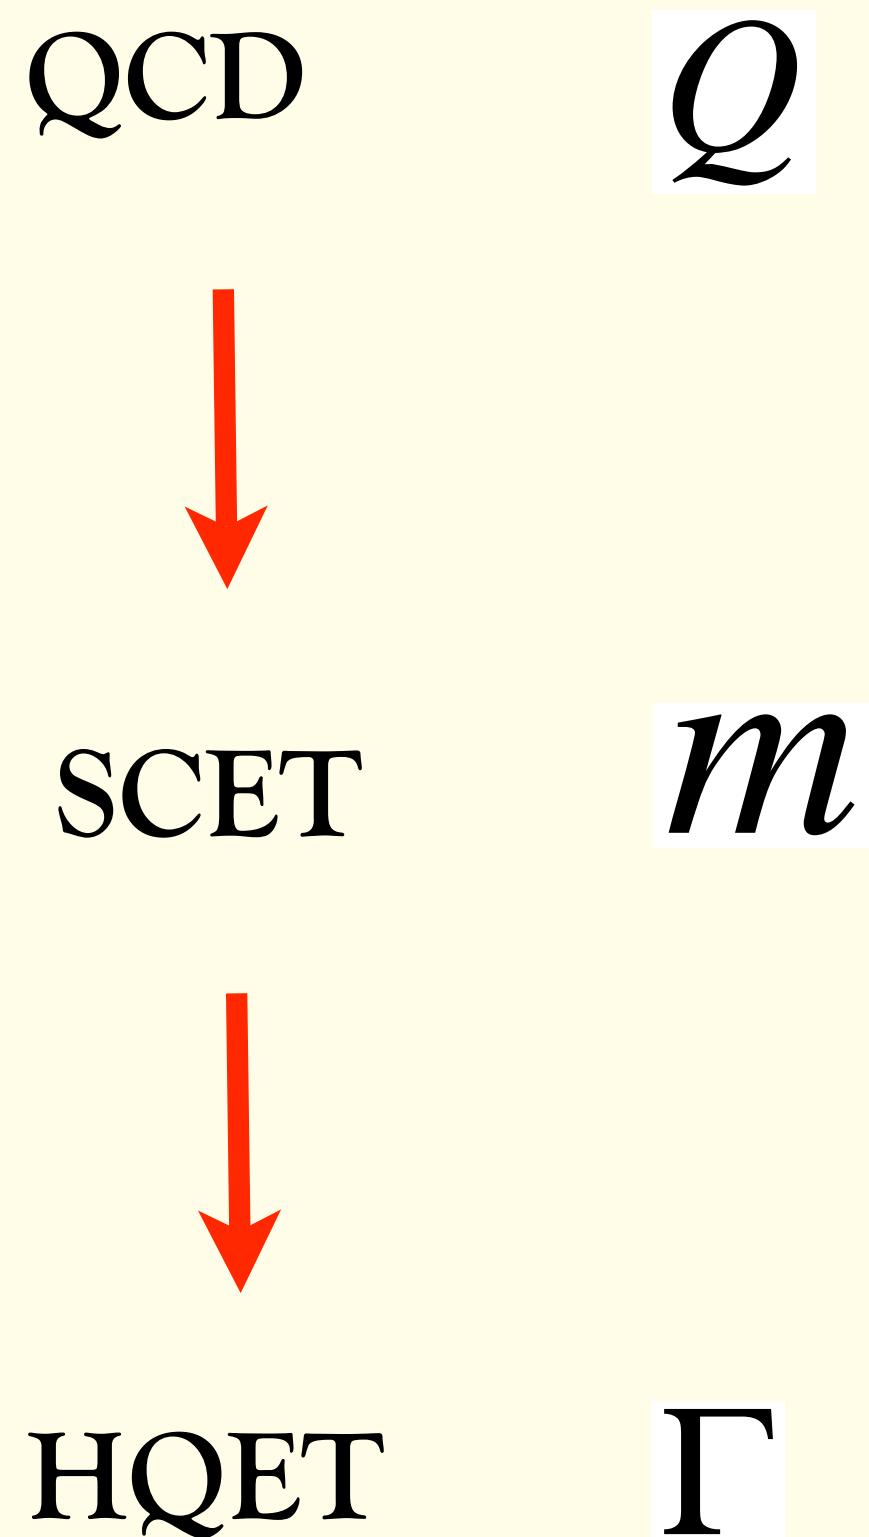

Kinematics for Top Jets: II

- **Invariant Mass Condition:** We characterize on shell production by the requirement:

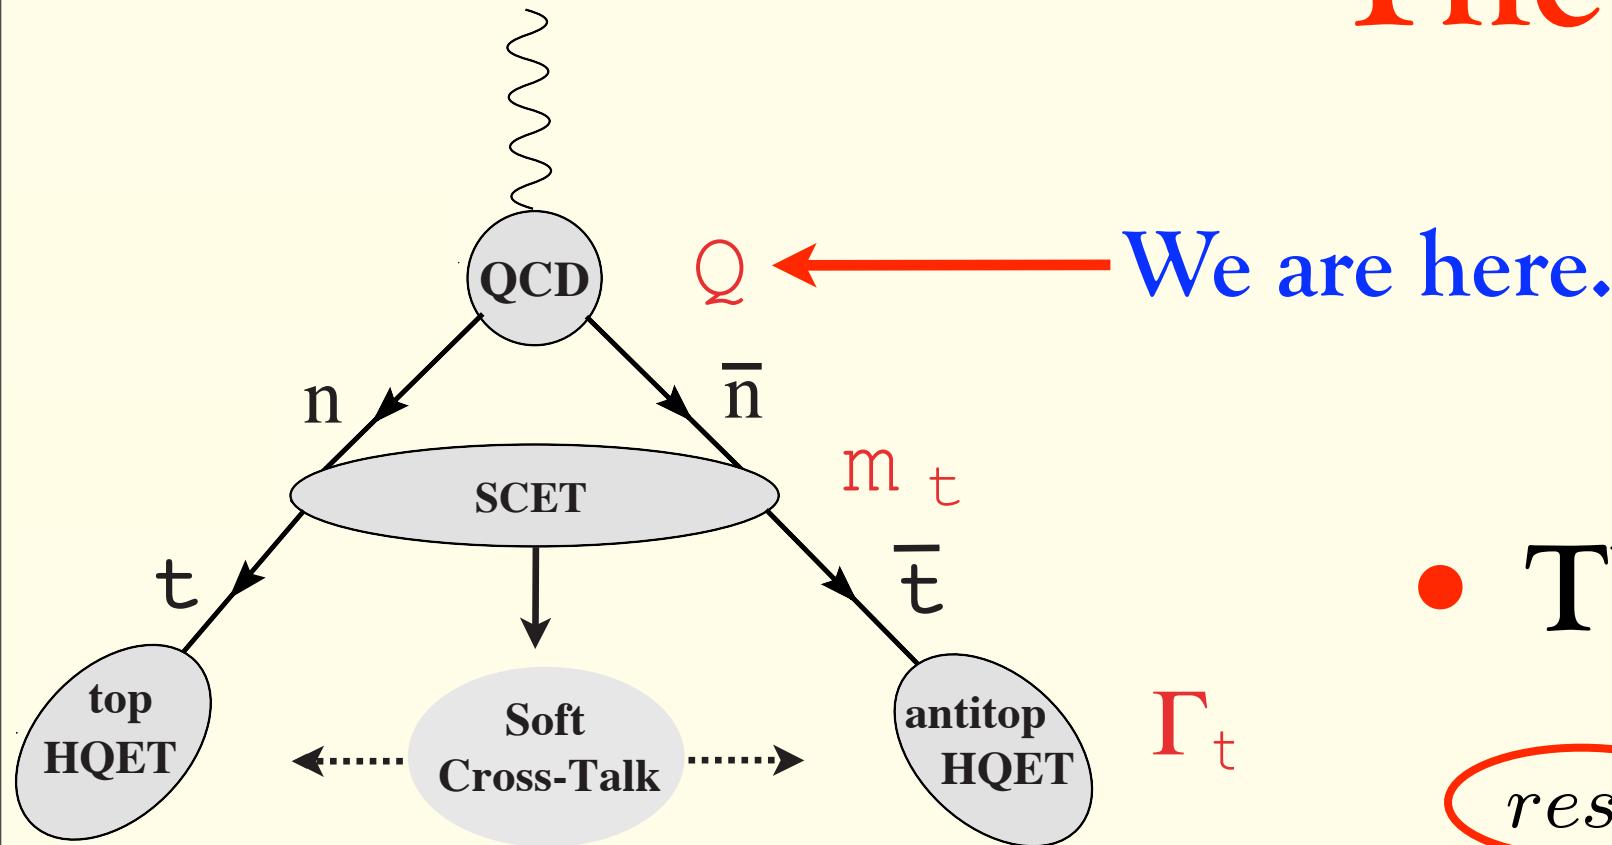

$$M_{t,\bar{t}}^2 - m^2 \lesssim m\Gamma$$

- This condition looks like the invariant mass constraint on a heavy quark in **Heavy Quark Effective Theory (HQET)** (Isgur, Wise,...).
- HQET has been generalized to unstable particles(Beneke, Chayovsky, Signer, Zanderighi).

Group Photo of Effective Field Theories

The QCD Cross-Section

- The cross-section in QCD has the general form :

$$\sigma = \sum_X (2\pi)^4 \delta^4(p_e + p_{\bar{e}} - p_X) \sum_{ij} L_{\mu\nu}^{(ij)} \langle 0 | J_i^\mu(0) | X \rangle \langle X | J_j^{\dagger\nu}(0) | 0 \rangle$$

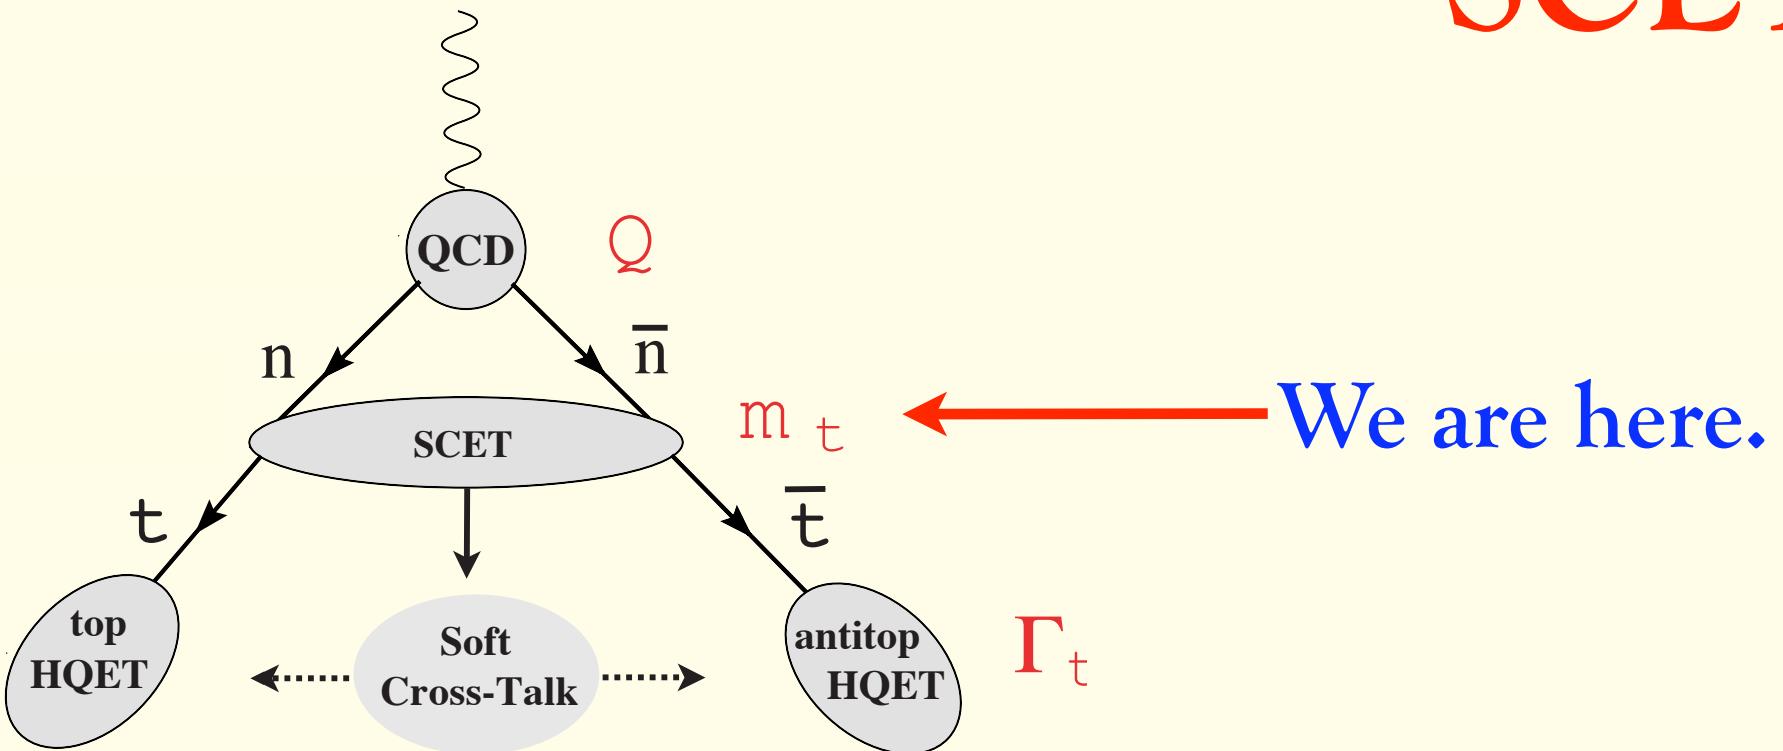

res.

- The sum over final states X is restricted to contain a top jet and an anti-top jet with invariant masses close to the top mass.
- The top quark currents are produced by photon and Z exchange:

$$J_i^\mu(x) = \bar{\psi}(x) \Gamma_i^\mu \psi(x), \quad \Gamma_\gamma^\mu = \gamma^\mu, \quad \Gamma_Z^\mu = g^V \gamma^\mu + g^A \gamma^\mu \gamma_5$$

SCET Cross-section

(Fleming, Hoang, Mantry, Stewart)

- The SCET cross section takes the form:

$$\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} = \sigma_0 H_Q(Q, \mu) \int_{-\infty}^{\infty} d\ell^+ d\ell^- J_n(s_t - Q\ell^+, \mu) J_{\bar{n}}(s_{\bar{t}} - Q\ell^-, \mu) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

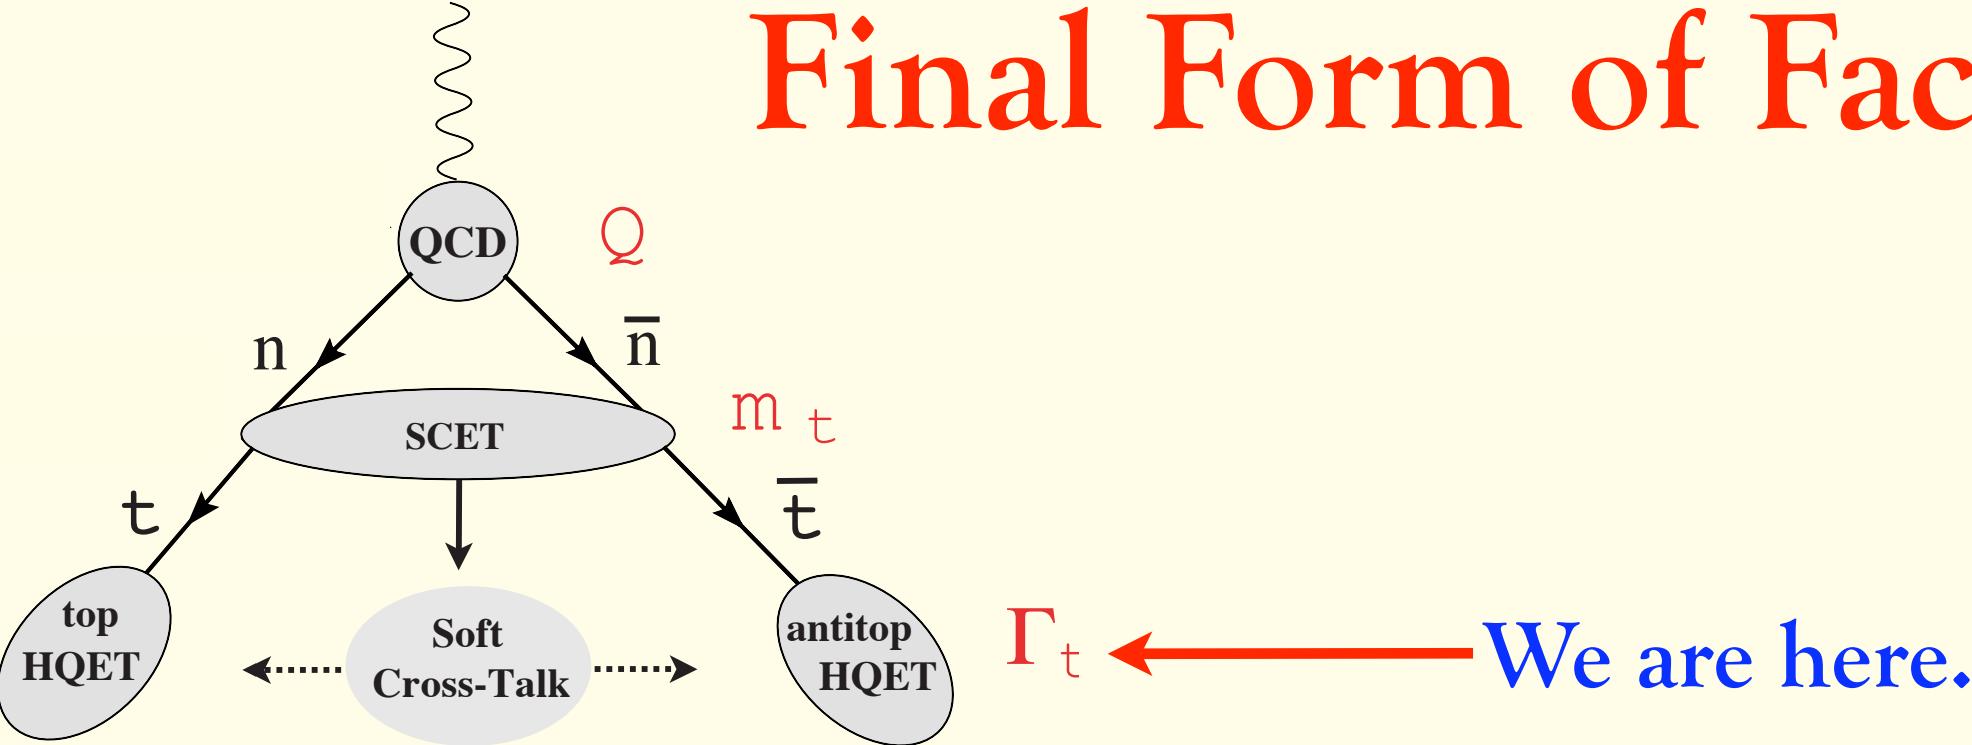

Hard Wilson Coefficient Top Jet Function Anti-Top Jet Function Soft Cross Talk Function

- The same soft function appears in massless dijets(Korchemsky & Sterman; Bauer, Lee, Manohar, Wise; Becher & Schwartz).

↓
 Extraction of strong
 coupling from LEP data

Final Form of Factorized Cross-Section

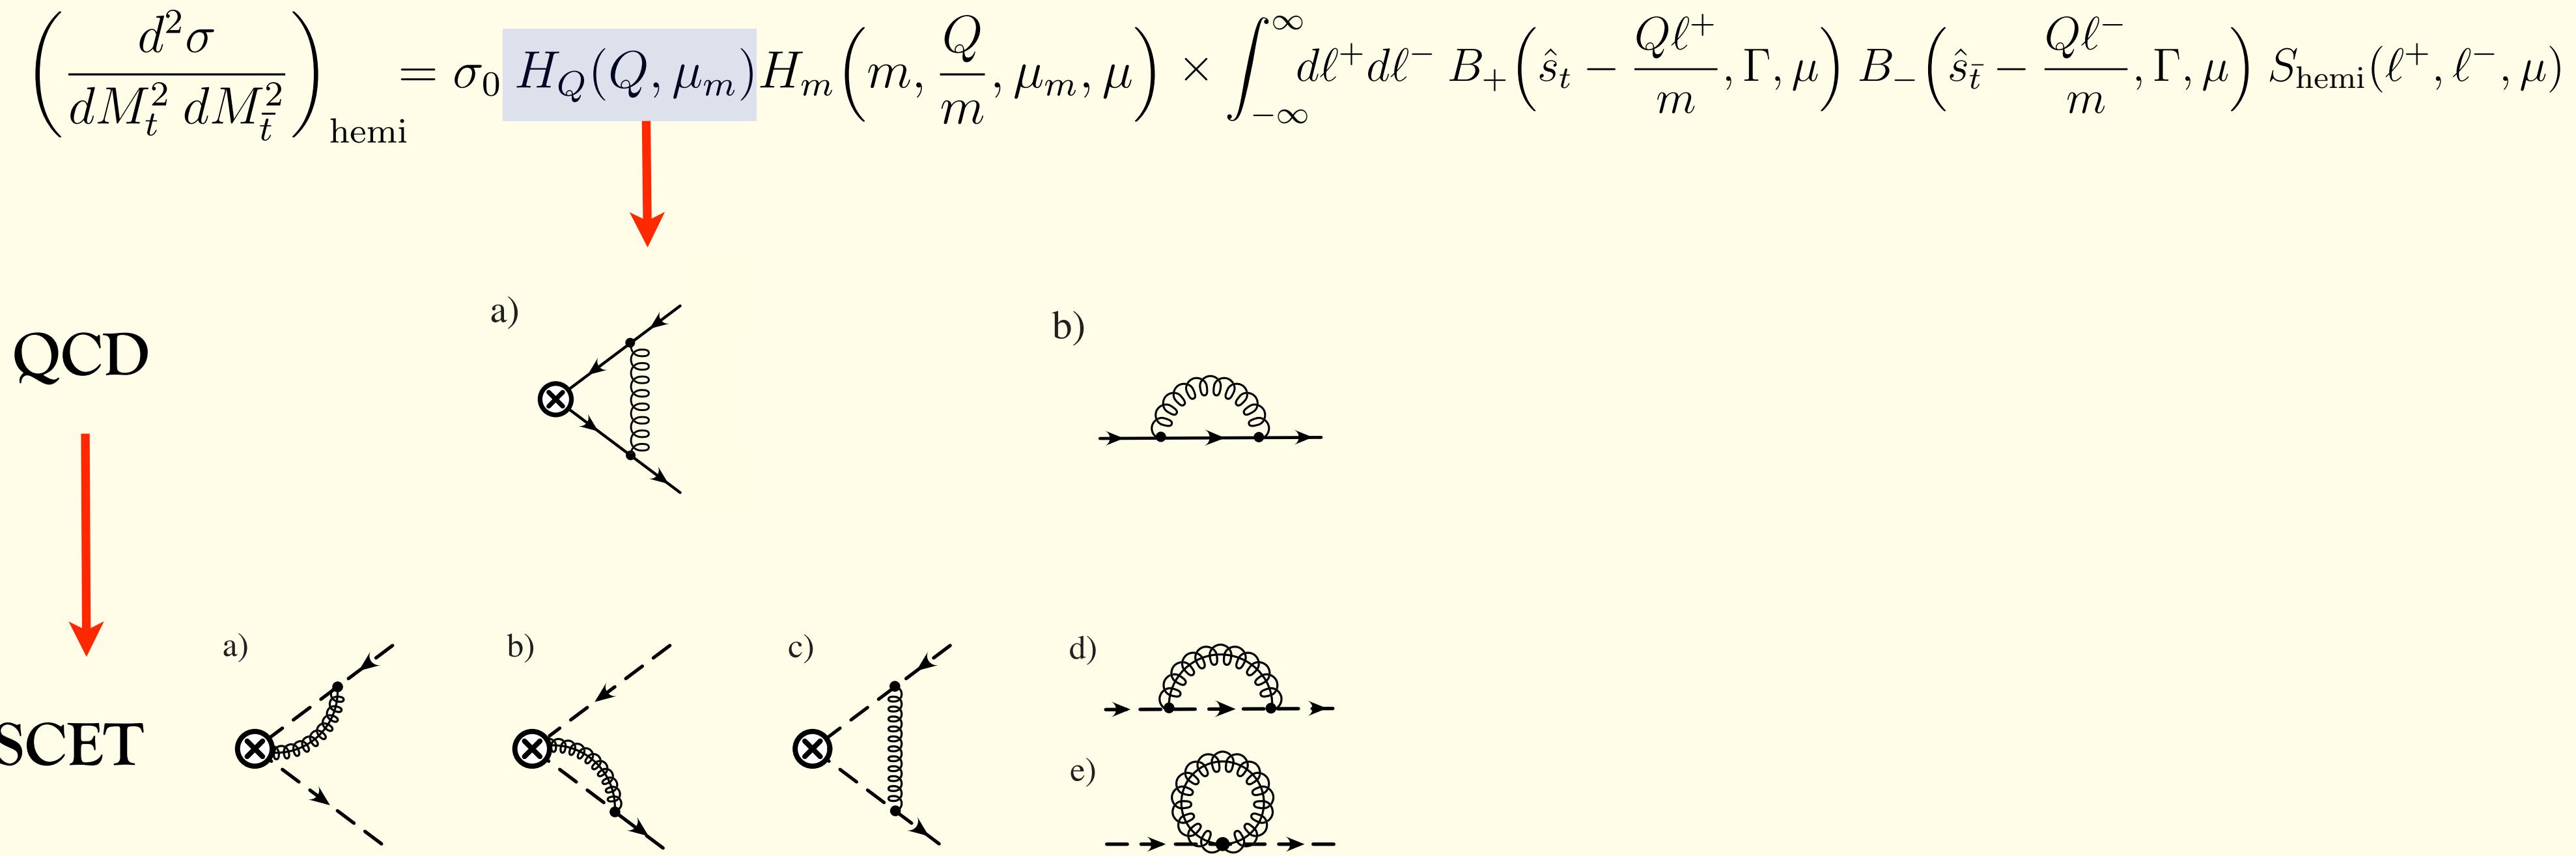

(Fleming, Hoang, Mantry, Stewart)

- The HQET cross section takes the form:

$$\begin{aligned}
 & \text{Hard Production modes integrated out} \\
 & \text{“Hard” collinear gluons integrated out} \\
 & \text{Evolution and decay of top quark close to mass shell} \\
 & \text{Non-perturbative Cross talk}
 \end{aligned}
 \quad
 \left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m \left(m, \frac{Q}{m}, \mu_m, \mu \right) \\
 \times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+ \left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu \right) B_- \left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu \right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

Matching QCD onto SCET at One Loop

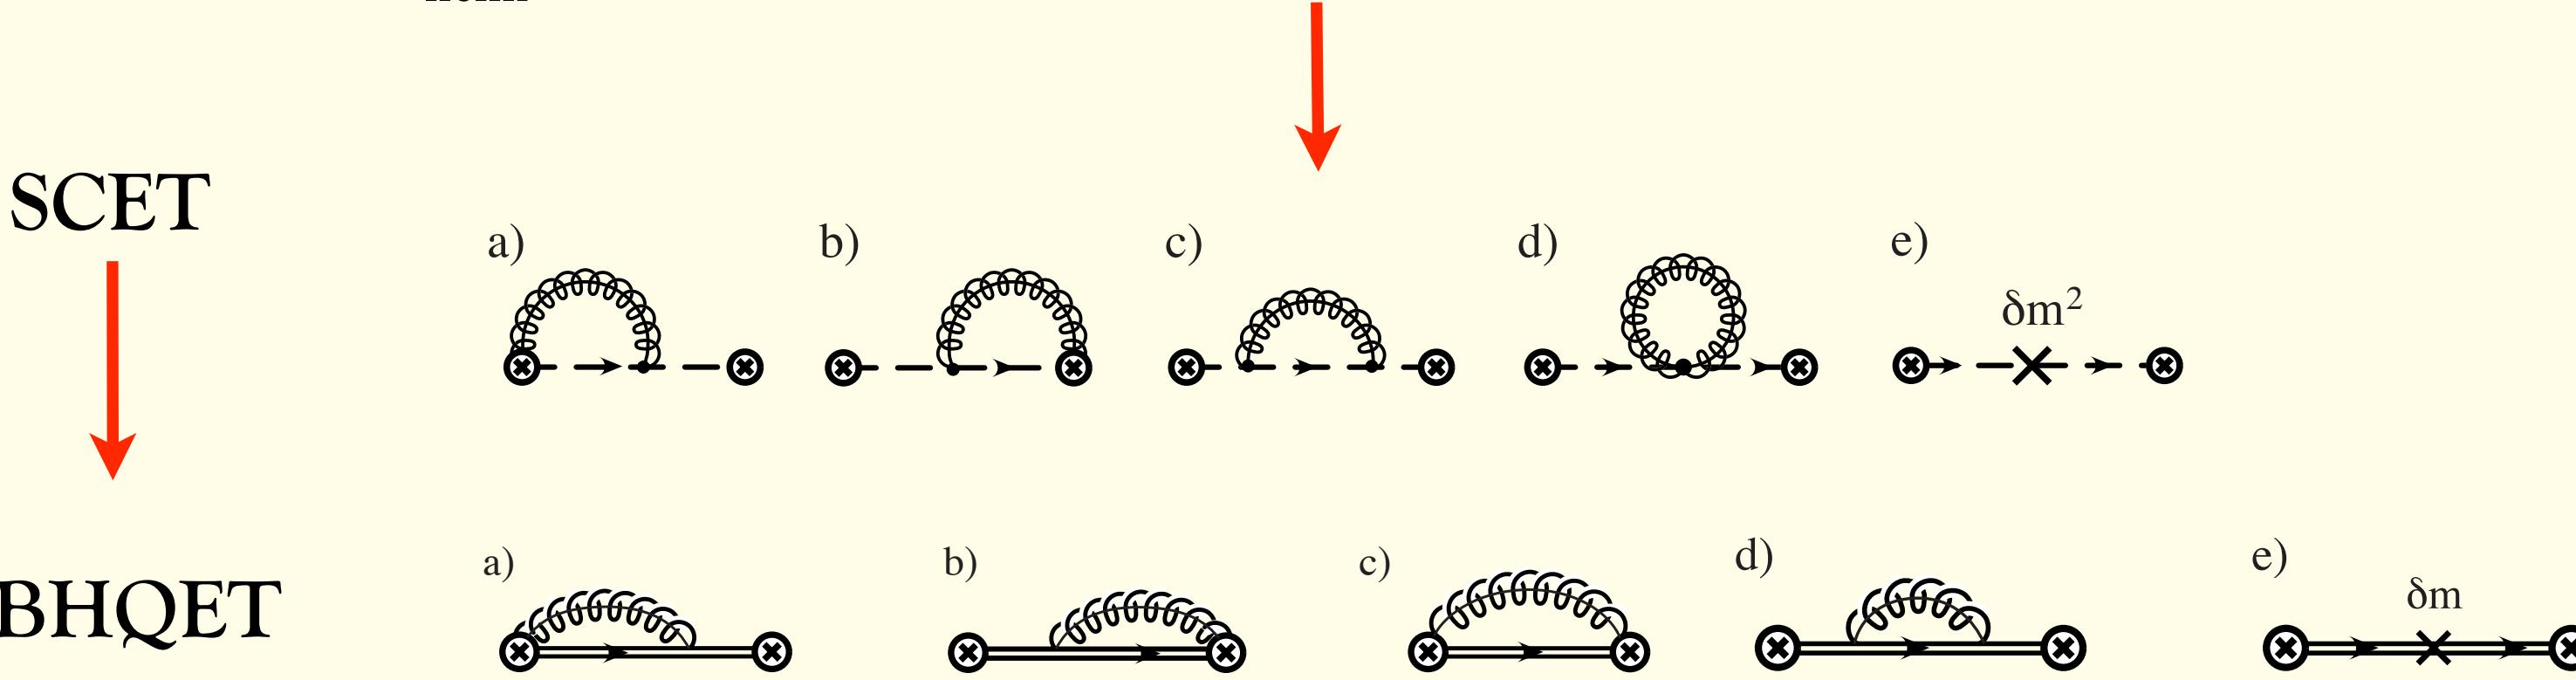

- Matching QCD production current onto SCET at the hard scale:

$$C(\mu) = 1 + \frac{\alpha_s C_F}{4\pi} \left[3 \ln \frac{-Q^2}{\mu^2} - \ln^2 \frac{-Q^2}{\mu^2} - 8 + \frac{\pi^2}{6} \right]$$

$$H_Q(Q, \mu_Q) = |C(Q, \mu_Q)|^2 = 1 + \frac{\alpha_s C_F}{4\pi} \left[-2 \ln^2 \left(\frac{Q^2}{\mu_Q^2} \right) + 6 \ln \left(\frac{Q^2}{\mu_Q^2} \right) - 16 + \frac{7\pi^2}{3} \right]$$

Matching SCET onto BHQET at One Loop

$$\left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m\left(m, \frac{Q}{m}, \mu_m, \mu\right) \times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+\left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu\right) B_-\left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu\right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

- Matching SCET jet functions onto bHQET jet functions:

$$J_n(m\hat{s}, \Gamma, \mu_m) = T_+(m, \mu_m) B_+(\hat{s}, \Gamma, \mu_m), \quad T_\pm(\mu, m) = 1 + \frac{\alpha_s C_F}{4\pi} \left(\ln^2 \frac{m^2}{\mu^2} - \ln \frac{m^2}{\mu^2} + 4 + \frac{\pi^2}{6} \right).$$

$$J_{\bar{n}}(m\hat{s}, \Gamma, \mu_m) = T_-(m, \mu_m) B_-(\hat{s}, \Gamma, \mu_m)$$

$$H_m\left(m, \mu_m\right) = T_+(m, \mu_m) T_-(m, \mu_m) = 1 + \frac{\alpha_s C_F}{2\pi} \left(\ln^2 \frac{\mu_m^2}{m^2} + \ln \frac{\mu_m^2}{m^2} + 4 + \frac{\pi^2}{6} \right)$$

Who Wants to Run in SCET?

$$\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} = \sigma_0 H_Q(Q, \mu) \int_{-\infty}^{\infty} d\ell^+ d\ell^- J_n(s_t - Q\ell^+, \mu) J_{\bar{n}}(s_{\bar{t}} - Q\ell^-, \mu) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

Run the Wilson
Coefficient:
Top Down

Run the jet and soft
functions:
Bottom Up

$$\mu \frac{d}{d\mu} H_Q(Q, \mu) = \gamma_{H_Q}(Q, \mu) H_Q(Q, \mu)$$

$$\begin{aligned} \mu \frac{d}{d\mu} J_{n,\bar{n}}(s, \mu) &= \int ds' \gamma_{J_{n,\bar{n}}}(s-s') J_{n,\bar{n}}(s', \mu) \\ \mu \frac{d}{d\mu} S(\ell^+, \ell^-, \mu) &= \int d\ell'^+ d\ell'^- \gamma_S(\ell^+ - \ell'^+, \ell^- - \ell'^-) S(\ell'^+, \ell'^-, \mu) \end{aligned}$$

- Scale independence of the cross-section requires the equivalence of **top down** and **bottom up** running. This provides a check on the consistency of the jet invariant mass definition.

Who Wants to Run in HQET?

$$\left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m\left(m, \frac{Q}{m}, \mu_m, \mu\right)$$

Run the Wilson Coefficient

$$\times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+\left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu\right) B_-\left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu\right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

Run the Jet & Soft functions

Top Down

Bottom Up

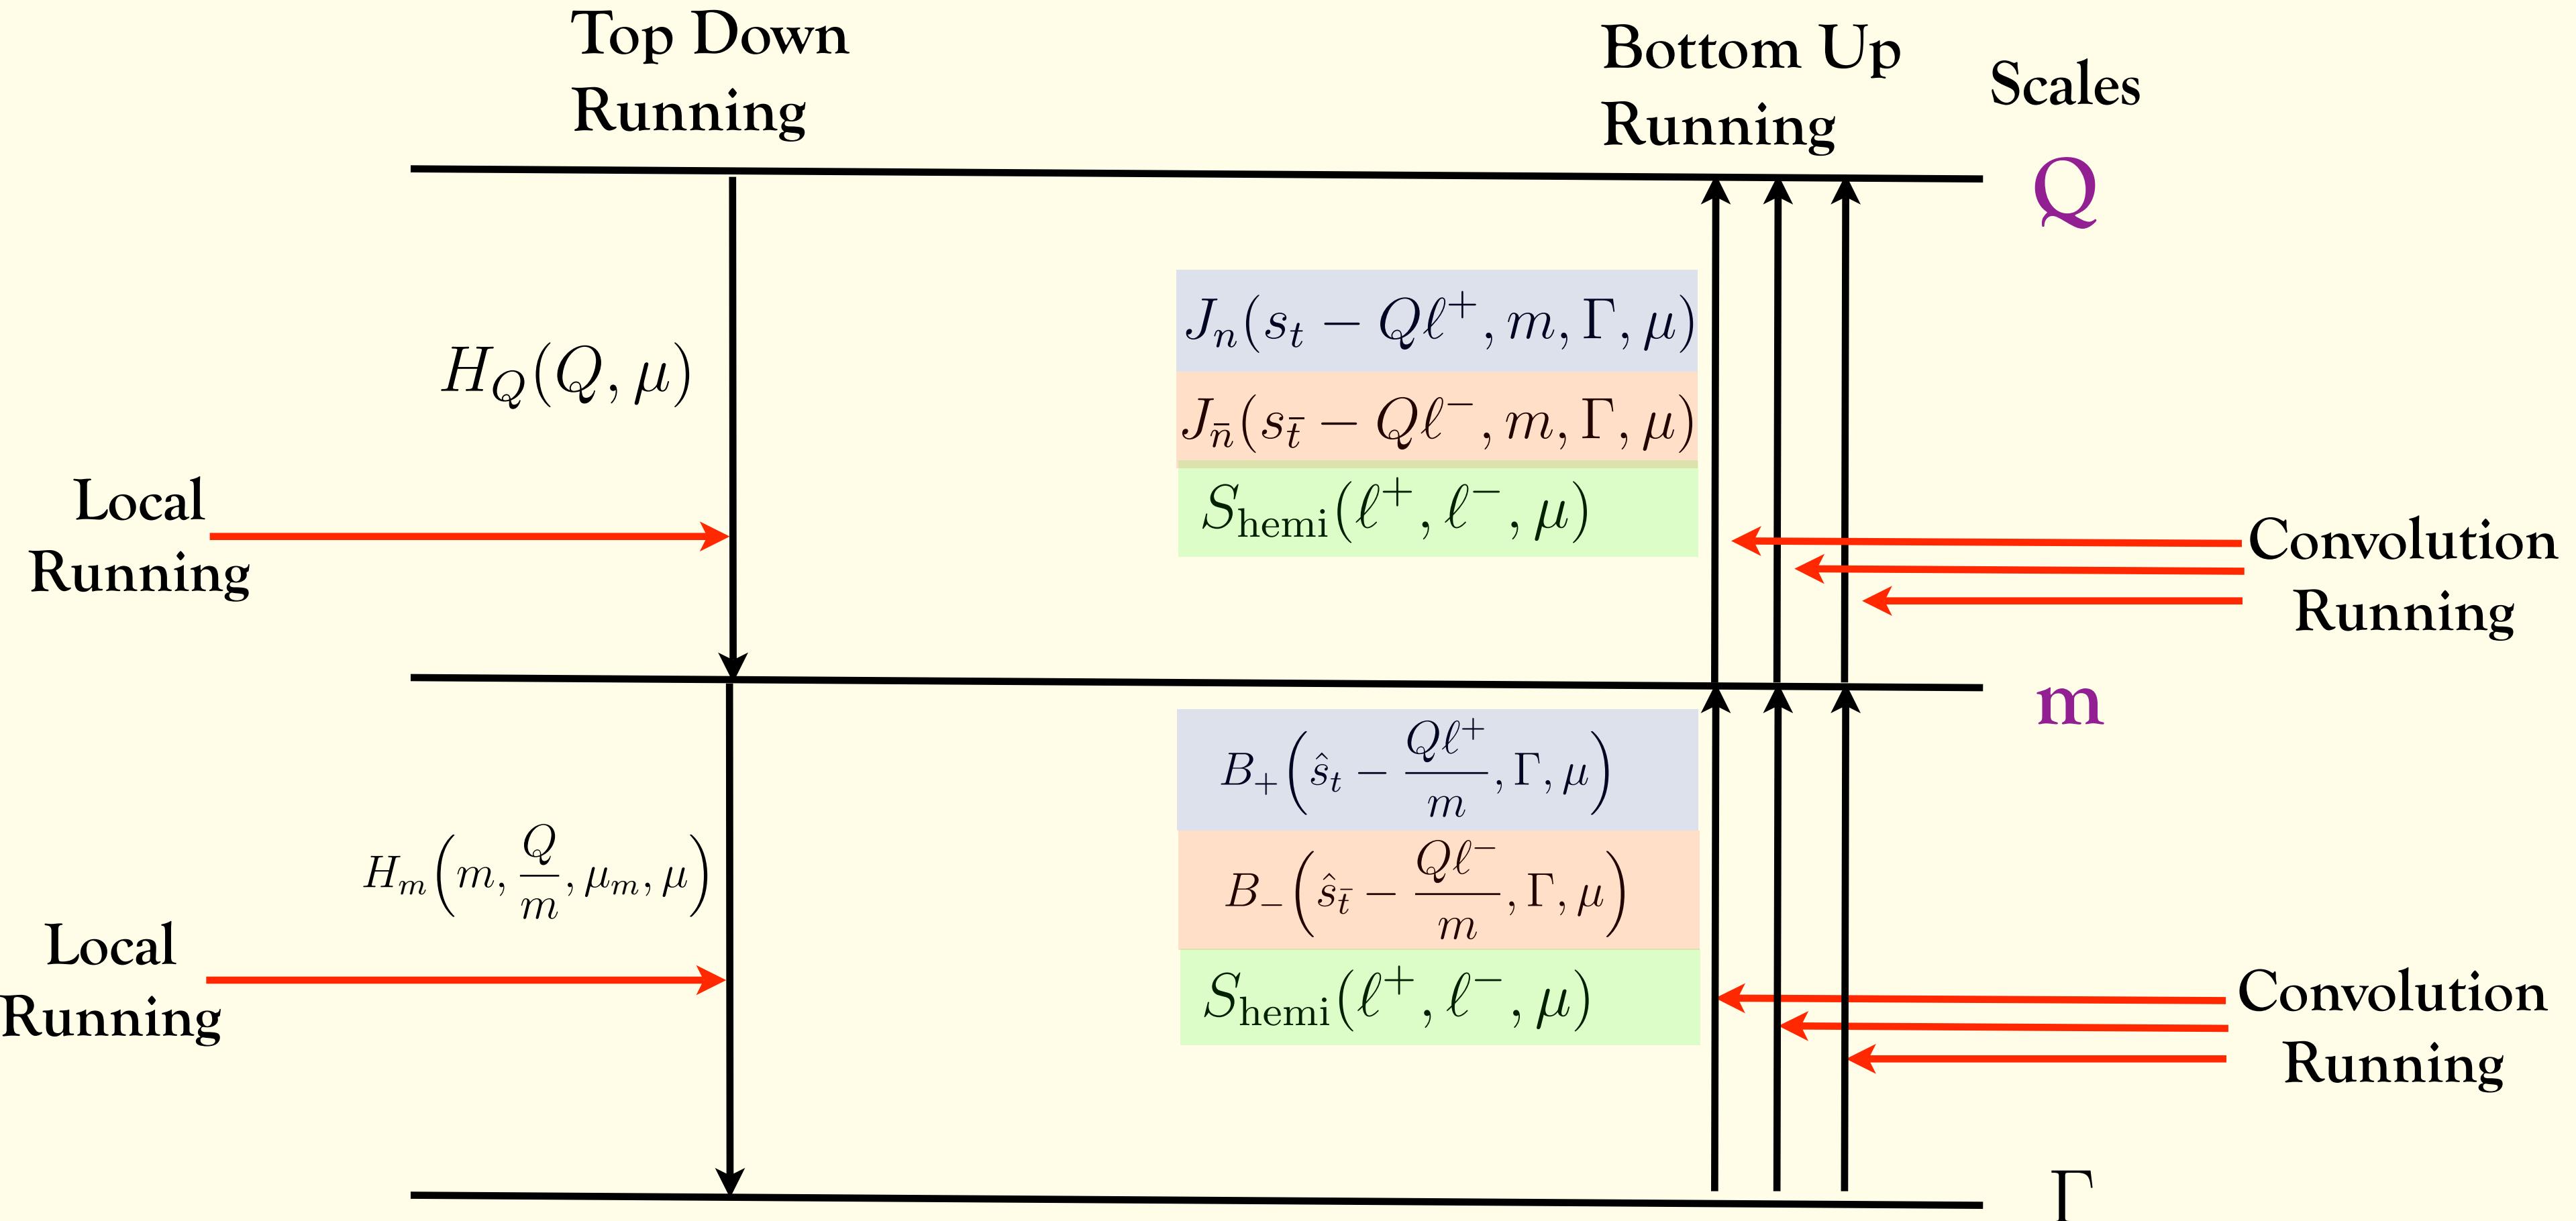

The diagram illustrates the two approaches to running in HQET. At the top, a red arrow points from the Wilson coefficient term to the overall cross-section equation. Below this, a large bracket covers the entire expression, with three red arrows pointing from the bottom up towards the Wilson coefficient, the jet/soft function terms, and the S_hemi function respectively. The 'Top Down' label is on the left, and the 'Bottom Up' label is on the right, both in purple.

$$\mu \frac{d}{d\mu} H_m\left(m, \frac{Q}{m}, \mu\right) = \gamma_{H_m}\left(\frac{Q}{m}, \mu\right) H_m\left(m, \frac{Q}{m}, \mu\right)$$

$$\begin{aligned} \mu \frac{d}{d\mu} B_{\pm}(\hat{s}, \mu) &= \int d\hat{s}' \gamma_{B_{\pm}}(\hat{s} - \hat{s}') B_{\pm}(\hat{s}', \mu) \\ \mu \frac{d}{d\mu} S_{\text{hemi}}(\ell^+, \ell^-, \mu) &= \int d\ell'^+ d\ell'^- \gamma_S(\ell^+ - \ell'^+, \ell^- - \ell'^-) S_{\text{hemi}}(\ell'^+, \ell'^-, \mu) \end{aligned}$$

- Scale independence of the cross-section requires the equivalence of **top down** and **bottom up** running. This provides a check on the consistency of the jet invariant mass definition.

Equivalence of Top-Down vs. Bottom Up

- Running between the different scales mostly affects only the normalization!

Short Distance Mass for Jets

Connecting the Observable to a Short Distance Mass Scheme

- Top mass sensitivity comes from the bHQET jet functions

$$\left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m \left(m, \frac{Q}{m}, \mu_m, \mu \right) \\ \times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+ \left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu \right) B_- \left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu \right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

- We have an analytic formula for the double differential jet invariant mass distribution in terms of the **pole mass**.
- We can now switch to a **short distance mass scheme in bHQET**.

$$m_{\text{pole}} = m + \delta m$$

Switching Mass Schemes in bHQET

$$\left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m \left(m, \frac{Q}{m}, \mu_m, \mu \right) \times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+ \left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu \right) B_- \left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu \right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

Top HQET

$$\mathcal{L}_+ = \bar{h}_{v_+} \left(i v_+ \cdot D_+ - \delta m + \frac{i}{2} \Gamma \right) h_{v_+},$$

Anti-Top HQET

$$\mathcal{L}_- = \bar{h}_{v_-} \left(i v_- \cdot D_- - \delta m + \frac{i}{2} \Gamma \right) h_{v_-}$$

Top mass scheme

- Power counting in bHQET requires

$$\delta m \sim \hat{s}_t \sim \hat{s}_{\bar{t}} \sim \Gamma$$

- Note that this power counting breaks down in the $\overline{\text{MS}}$ scheme:

$$\delta \overline{m} \sim \alpha_s \overline{m} \gg \Gamma$$

- We need a short distance mass that respects the power counting of bHQET.

Top Resonance Mass Schemes

$$\left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m \left(m, \frac{Q}{m}, \mu_m, \mu \right) \times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+ \left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu \right) B_- \left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu \right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

- Top resonance mass schemes are compatible with measurements relying on an underlying Breit-Wigner which incorporates the top width:

$$\delta m \sim \hat{s}_t \sim \hat{s}_{\bar{t}} \sim \Gamma$$

- Some mass schemes in this context are

- Peak Mass
- Moment Mass
- Position Mass (*Jain, Scimemi, Stewart*)

$$\frac{d}{d\hat{s}} B(\hat{s}, \delta m^{\text{peak}}, \Gamma_t, \mu) \Big|_{\hat{s}=0} = 0$$

$$\int_{-\infty}^R d\hat{s} \, \hat{s} \, B(\hat{s}, \delta m^{\text{mom}}, \mu) = 0$$

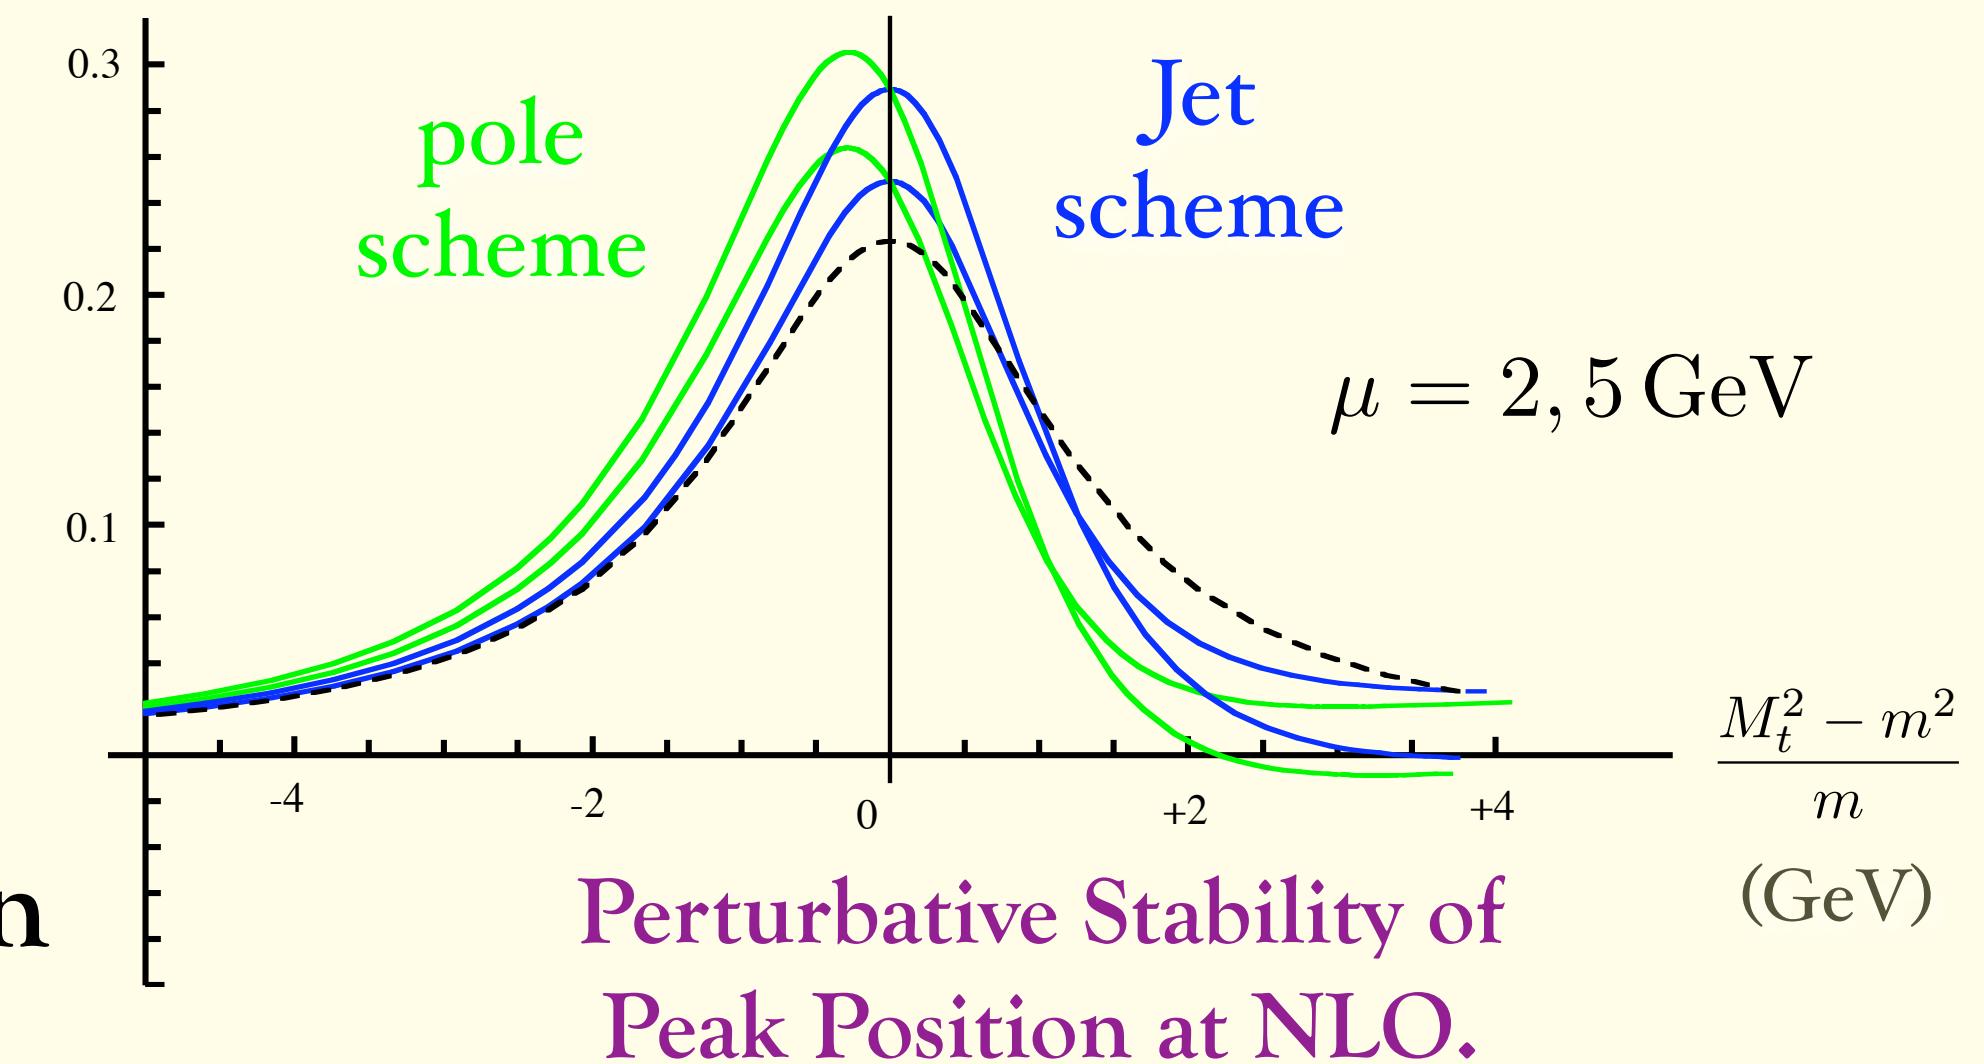

$$\delta m_J = \frac{-i}{2 \tilde{B}(y, \mu)} \frac{d}{dy} \tilde{B}(y, \mu) \Big|_{y=-ie^{-\gamma_E}/R}$$

- These top resonance mass schemes can be related to the more familiar mass schemes.

Peak Mass

- Define peak mass as:

$$\frac{dB_+(\hat{s}, \mu, \delta m_J)}{d\hat{s}} \Big|_{\hat{s}=0} = 0$$

- In the jet mass scheme the NLO jet function is modified as:

$$\tilde{B}_\pm(\hat{s}, \mu) = B_\pm(\hat{s}, \mu) + \frac{1}{\pi m_J} \frac{(4 \hat{s} \Gamma) \delta m_J}{(\hat{s}^2 + \Gamma^2)^2}$$

- At NLO the jet mass is related to the pole mass scheme as follows:

$$m_J(\mu) = m_{\text{pole}} - \Gamma \frac{\alpha_s(\mu)}{3} \left[\ln \left(\frac{\mu}{\Gamma} \right) + \frac{3}{2} \right]$$

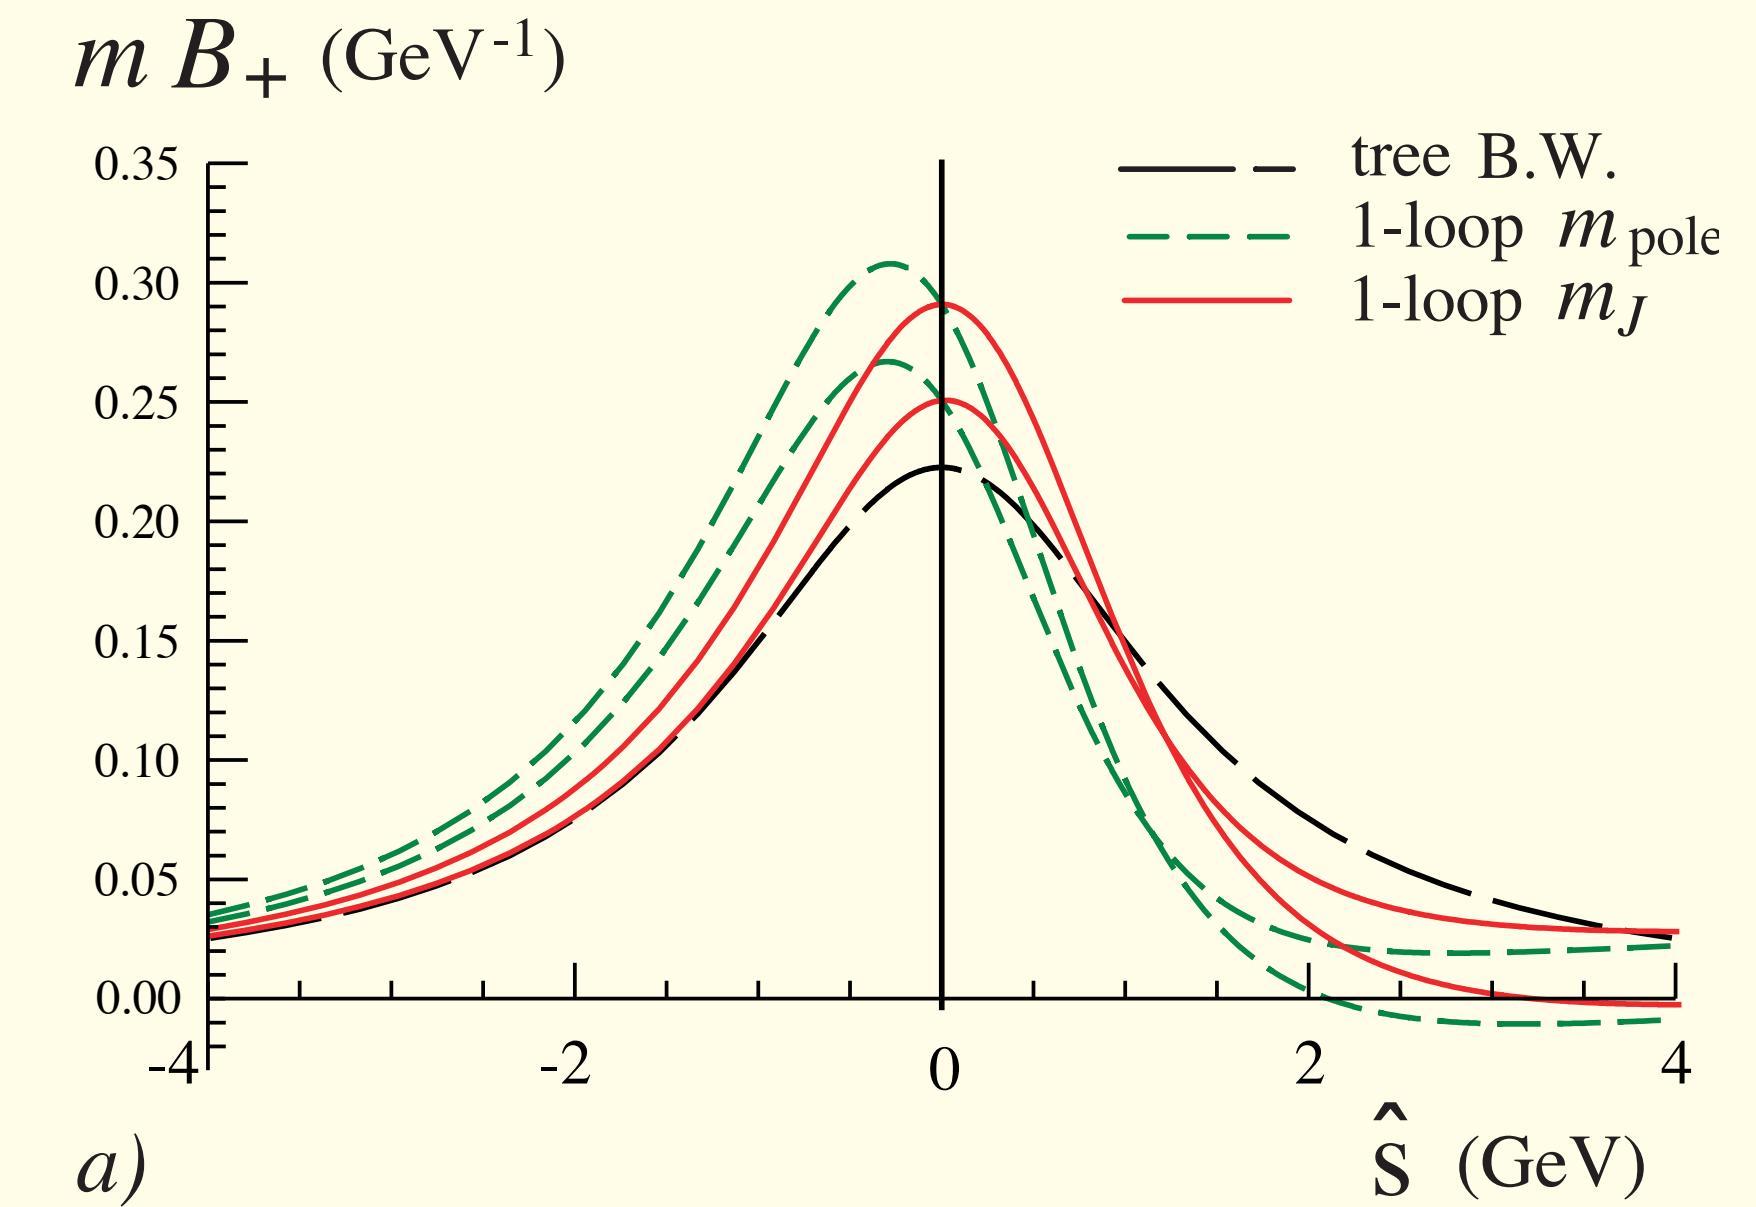

Moment Mass

- Define the moment mass scheme as:

$$0 = \int_{-\infty}^{L_m} d\hat{s} \ \hat{s} \ B_+^{\Gamma=0}(\hat{s}, \delta m_J), \quad L_m \sim \Gamma_t.$$

- At NLO we get:

$$\delta m_J = L_m \frac{\alpha_s(\mu) C_F}{\pi} \left[\ln\left(\frac{\mu}{L_m}\right) + \frac{3}{2} \right].$$

IR Group Flow of the Top Mass

(Hoang, Jain, Scimemi, Stewart)

- Mass schemes can be parameterized by ‘R’.

$$m_{\text{pole}} = m(R, \mu) + \delta m(R, \mu),$$

$$\delta m(R, \mu) = R \sum_{n=1}^{\infty} \sum_{k=0}^n a_{nk} \left[\frac{\alpha_s(\mu)}{4\pi} \right]^n \ln^k \left(\frac{\mu}{R} \right)$$

- MSbar and top resonance schemes satisfy

$$\overline{\text{MS}} : R' = \bar{m}(\mu) \gg \Gamma_t, \quad \text{Top Resonance scheme} : R \sim \Gamma_t \ll m$$

- Conversion between such schemes can introduce large logs of

$$\log \frac{R'}{R}$$

- These logs are summed by an IR group flow(more details in 0803.4214, HJSS).

$$R \frac{d}{dR} m(R) = -R \gamma_R [\alpha_s(R)]$$

Non-Perturbative Effects

Soft Function

$$\left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m \left(m, \frac{Q}{m}, \mu_m, \mu \right) \times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+ \left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu \right) B_- \left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu \right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

- Soft function is non-perturbative and encodes the cross-talk between top jets.
One can model these effects as

- The ‘model’ soft function is taken to be of the form

$$S_{\text{mod}}(\ell^+, \ell^-, \Delta) = f_{\text{exp}}(\ell^+ - \Delta, \ell^- - \Delta),$$

Gap parameter 

$$f_{\text{exp}}(\ell^+, \ell^-) = \theta(\ell^+) \theta(\ell^-) \frac{\mathcal{N}(a, b)}{\Lambda^2} \left(\frac{\ell^+ \ell^-}{\Lambda^2} \right)^{a-1} \exp \left(\frac{-(\ell^+)^2 - (\ell^-)^2 - 2b\ell^+\ell^-}{\Lambda^2} \right)$$

$$\left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m \left(m, \frac{Q}{m}, \mu_m, \mu \right) \times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+ \left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu \right) B_- \left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu \right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

- The partonic soft function has a renormalon (*Gardi; Hoang, Stewart*)

$$S(\ell^+, \ell^-, \mu) = \int_{-\infty}^{+\infty} d\tilde{\ell}^+ \int_{-\infty}^{+\infty} d\tilde{\ell}^- S_{\text{part}}(\ell^+ - \tilde{\ell}^+ - \delta, \ell^- - \tilde{\ell}^- - \delta, \mu) f_{\text{exp}}(\tilde{\ell}^+ - \bar{\Delta}, \tilde{\ell}^- - \bar{\Delta})$$

↑
Renormalon
present

- The renormalon corresponds to an ambiguity in the gap parameter:

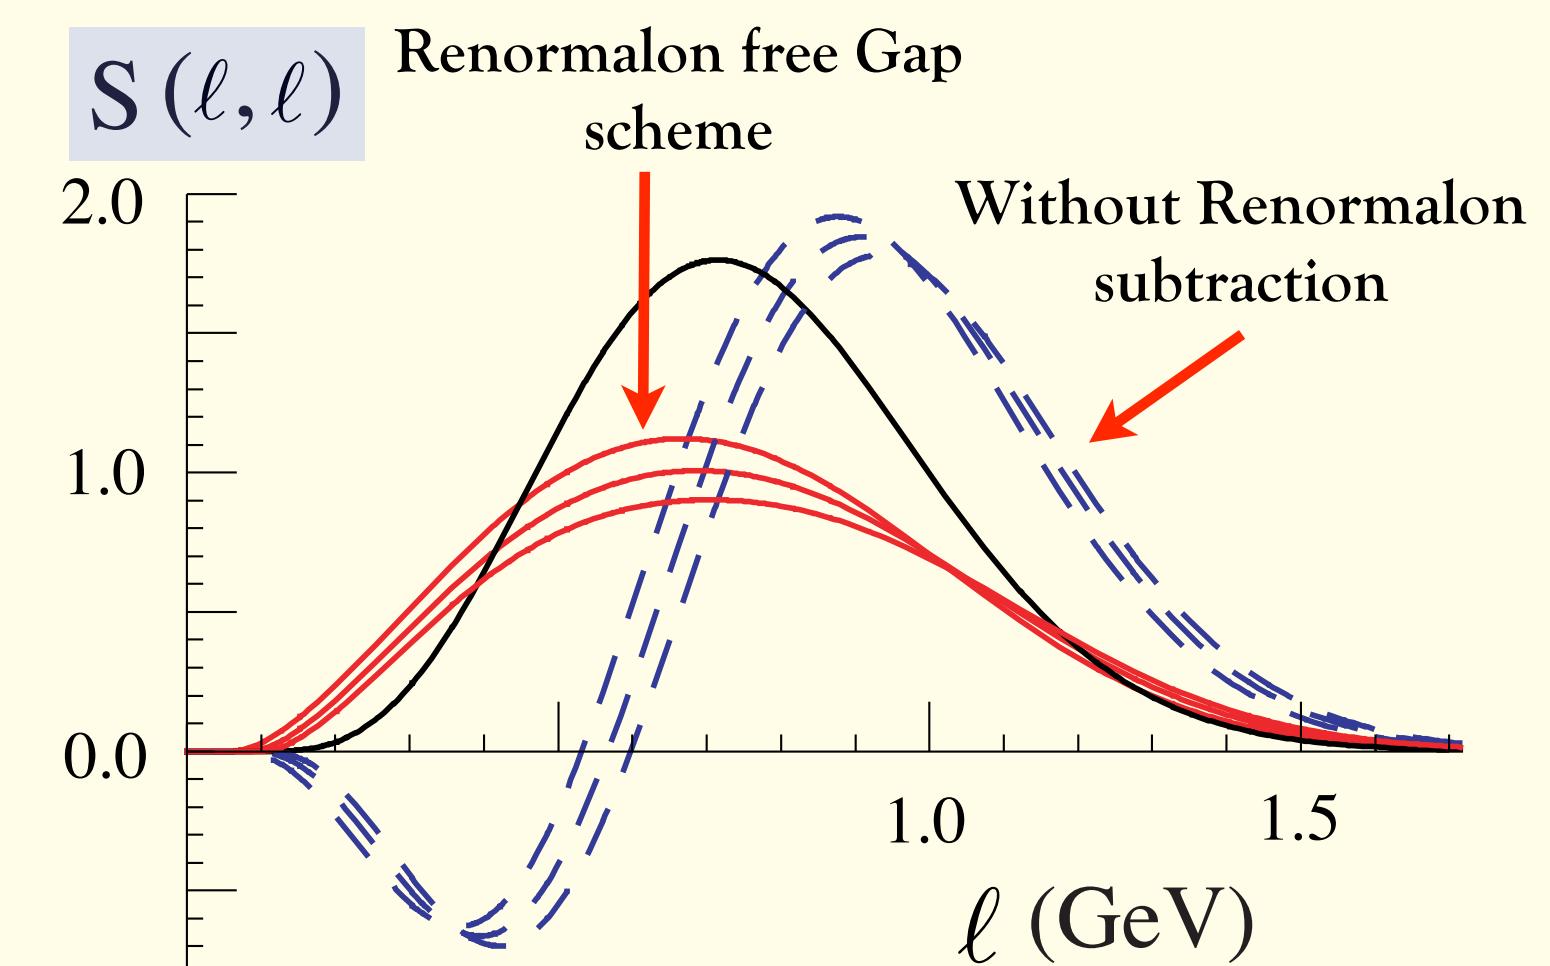

$$\Delta = \bar{\Delta}(\mu) + \delta(\mu)$$

↑
Renormalon free
Gap scheme

- Moment gap scheme:

$$0 = \int_{-\infty}^{L_\Delta} d\ell^+ \int_{-\infty}^{L_\Delta} d\ell^- \ell^+ S_{\text{part}}(\ell^+ - \delta, \ell^- - \delta, \mu)$$

$$\delta_1 = -2L_\Delta \frac{C_F \alpha_s(\mu)}{\pi} \left[\ln \left(\frac{\mu}{L_\Delta} \right) + 1 \right]$$

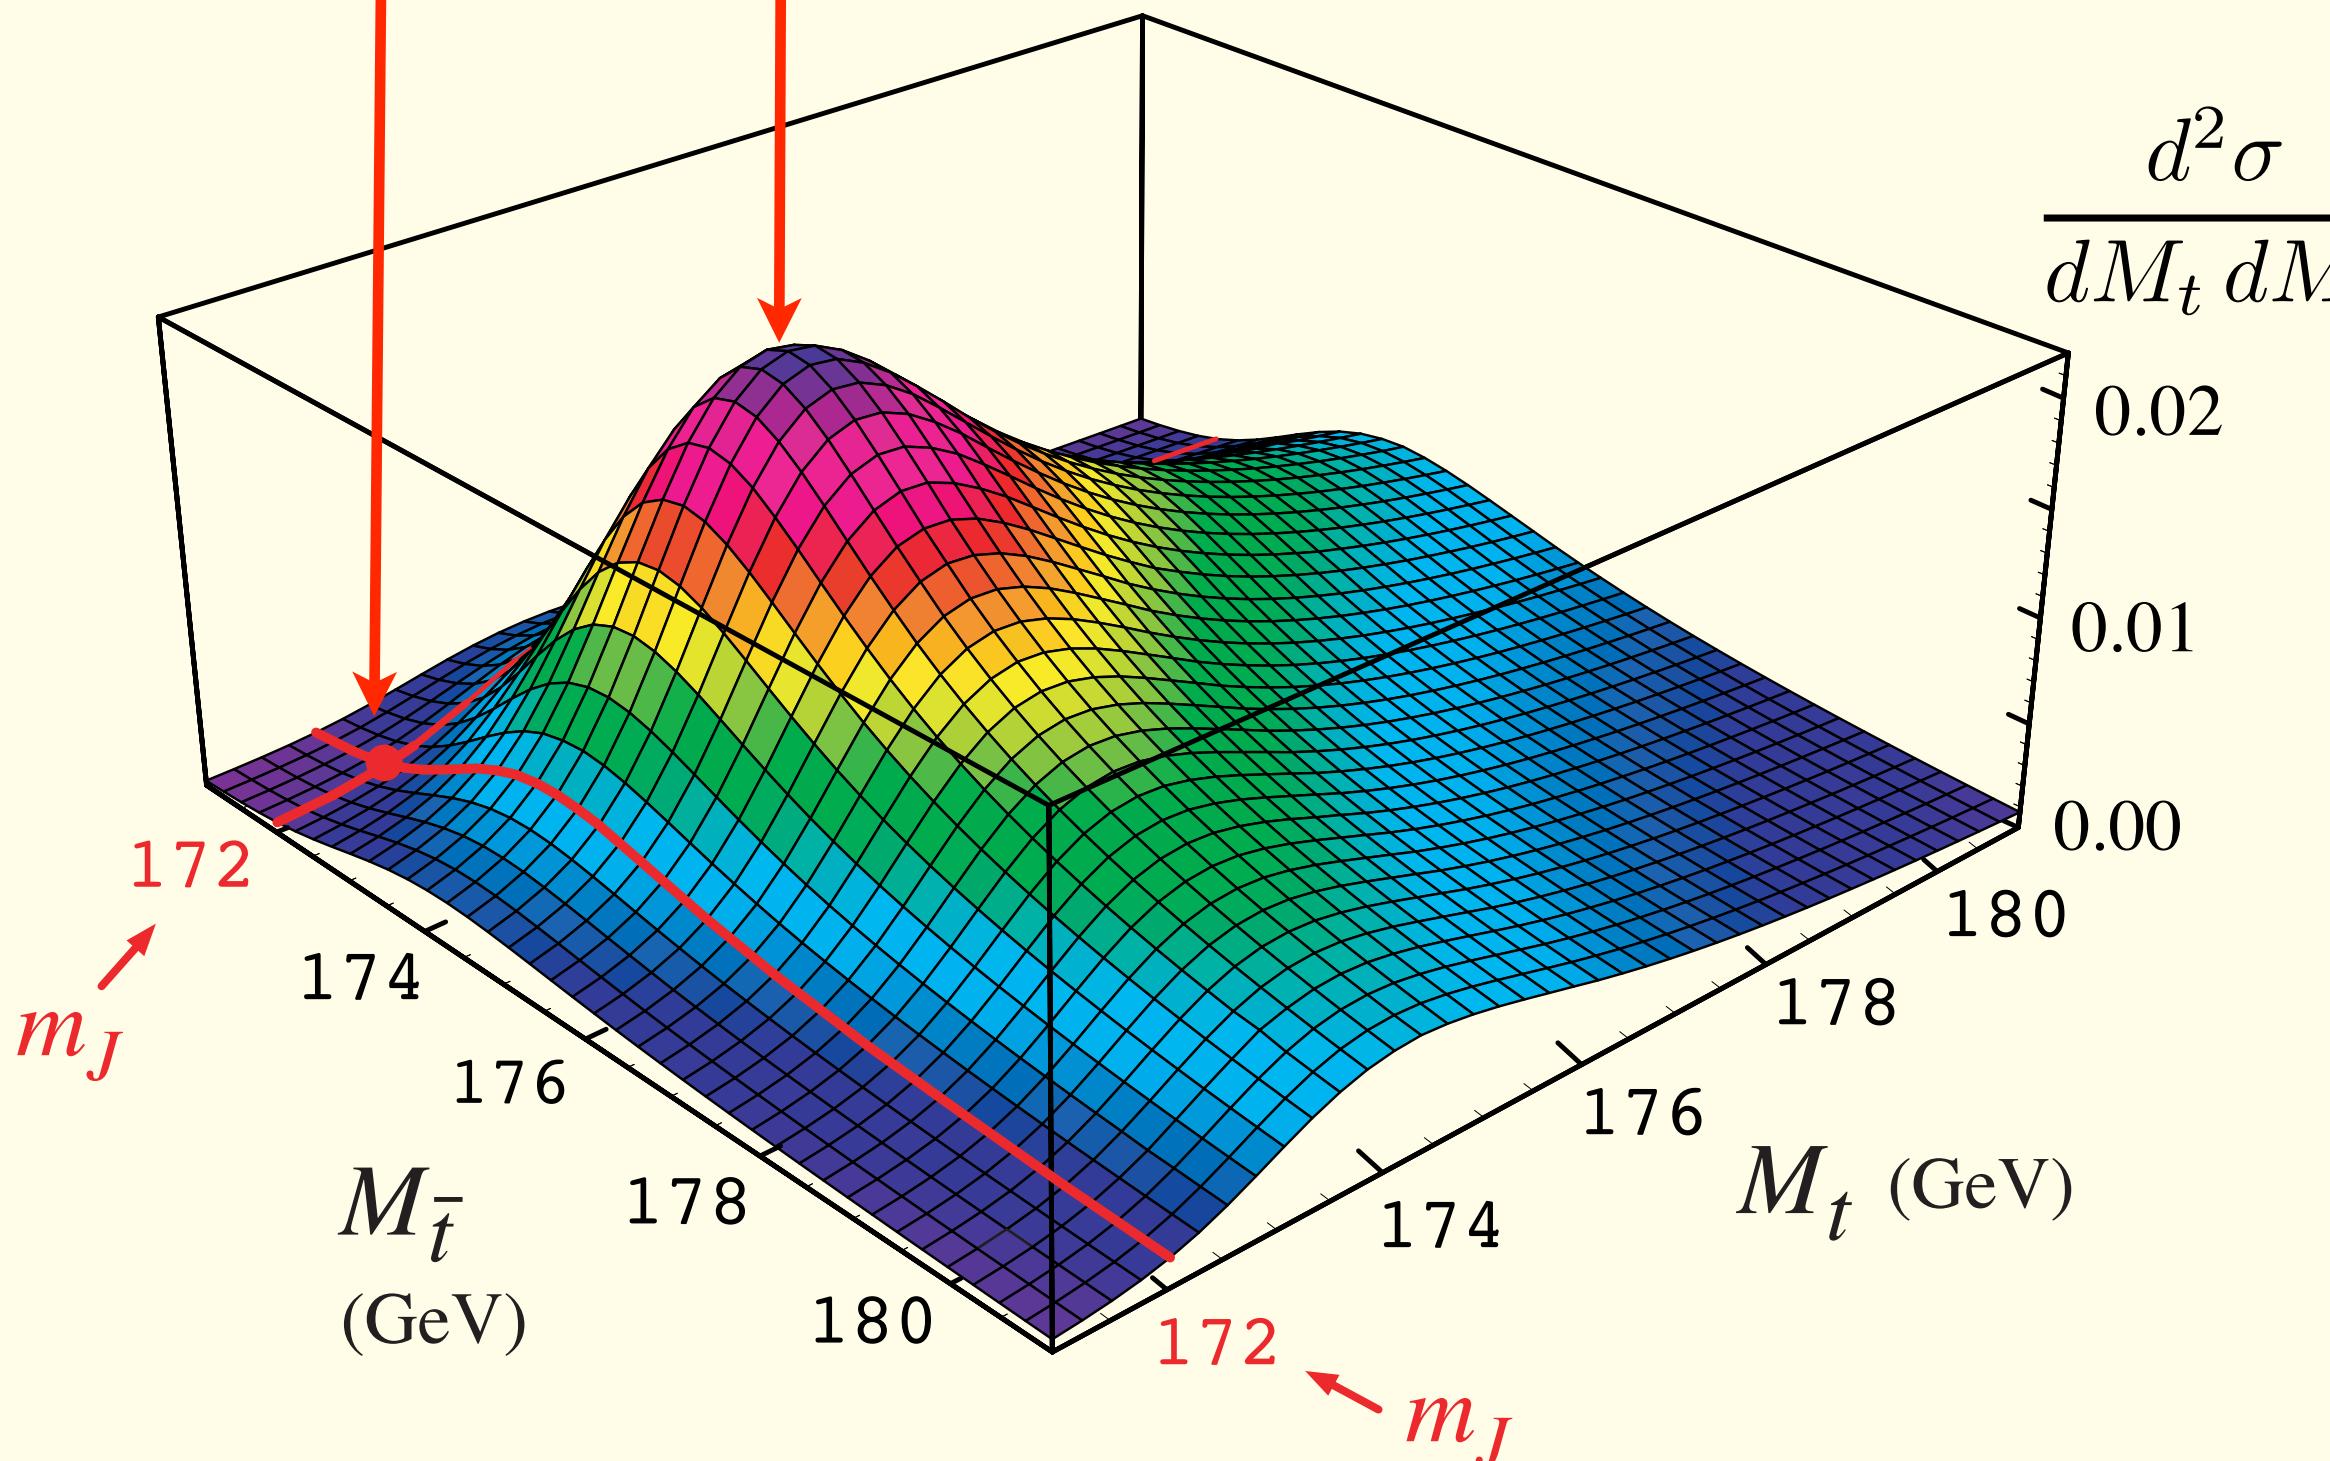

Extraction of the Short Distance Top Mass

$$\left(\frac{d^2\sigma}{dM_t^2 dM_{\bar{t}}^2} \right)_{\text{hemi}} = \sigma_0 H_Q(Q, \mu_m) H_m \left(m, \frac{Q}{m}, \mu_m, \mu \right) \times \int_{-\infty}^{\infty} d\ell^+ d\ell^- B_+ \left(\hat{s}_t - \frac{Q\ell^+}{m}, \Gamma, \mu \right) B_- \left(\hat{s}_{\bar{t}} - \frac{Q\ell^-}{m}, \Gamma, \mu \right) S_{\text{hemi}}(\ell^+, \ell^-, \mu)$$

Extract top mass \rightarrow

$$m = M_{\text{peak}} - \Gamma(\alpha_s + \alpha_s^2 + \dots) - \frac{Q\Lambda_{QCD}}{m}$$

- Final result with NLL resummation.
(Fleming, Hoang, Mantry, Stewart)

Conclusions

- An analytic framework in effective field theory now exists for high energy pair production of tops at a linear collider:
 - Factorization for high energy top pair production at a linear collider.
 - Large logarithms summed using RG equations in effective field theory; NLL resummation
 - Short distance mass schemes suitable for reconstruction from jets; Top resonance schemes
 - Measured peak position can be related to the short distance mass.
