# Detector Design Guidelines

- **Alternative to other Concepts**
  - No PFA for Calorimetry
  - No TPC for Central Tracking
  - No range-based Muon Detector
- **Low material budget in front of the Calorimeter**
- **Light -> no iron**
  - Good for in the (unfortunate) case of push-pull
- **Open mind toward the choice of technology**
  - Define a baseline configuration
  - Work in parallel over (reasonable) alternatives

# Detectors Comparison

|                    | ILD                        | SiD                  | 4-th                         |

# 4th Concept Detector

1. Vertex Detector 20-micron pixels (based on SLAC/FNAL design)
2. Drift Chamber with He gas and Cluster Counting
3. Double-readout calorimeter
4. Dual-solenoid with Muon Spectrometer

# Motivations for Baseline Configuration

- **He-based Drift Chamber with Cluster Counting**
  - Continuous tracking and seeding from Central Tracker
  - Lowest material budget
  - $\mathcal{O}(10^4)$  channels
  - Consolidated technology (i.e. Kloe)
  - Cost
- **Dual readout with time history of all channels**
  - Resolution scales as  $1/\sqrt{E}$  at all energies
  - $\mathcal{O}(10^4)$  channels
  - Cost
- **Dual Solenoid Muon Spectrometer**
  - No iron (field is fully contained)
  - Precise determination of momentum
  - Tail catcher
  - Independent calibration for the calorimeter (i.e. via  $\mu \rightarrow \mu\gamma$ )

8

ILCRoot simulation

# Beam Pipe and VXD layout

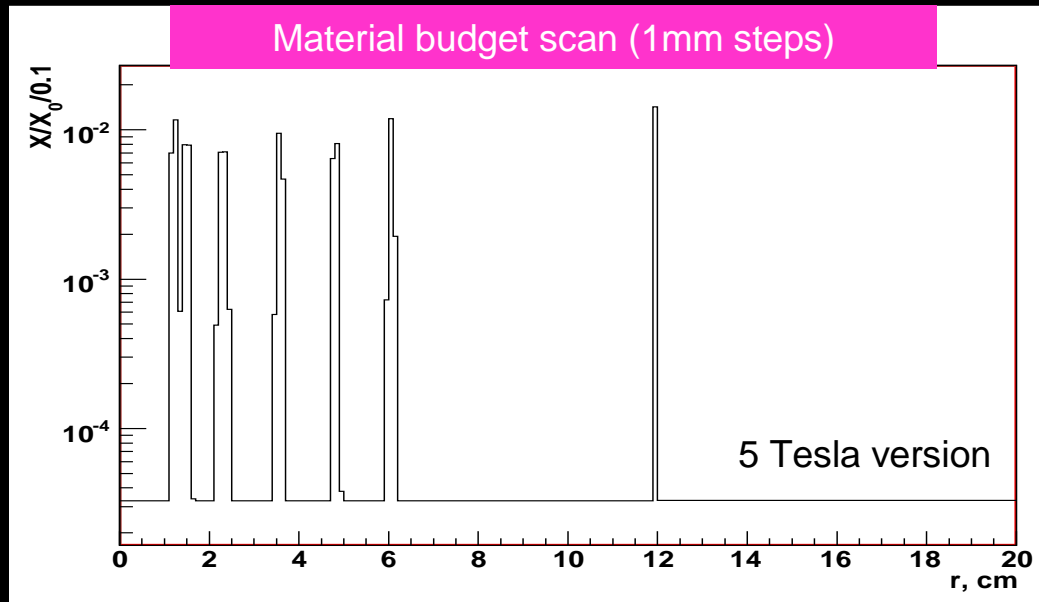

- Beam Pipe:
  - 400  $\mu\text{m}$  Be
  - 25  $\mu\text{m}$  Ti
- VXD: SiD layout (modified for 3.5 T)
  - 5 barrel layers (96 ladders) x 4 endcaps (96 sectors)
  - 20  $\mu\text{m}$  x 20  $\mu\text{m}$  pixel size
  - Total  $4.3 \times 10^9$  pixels
  - (Total  $2.5 \times 10^9$  pixels for 5 Tesla version)
  - Detector support: 100  $\mu\text{m}$  CarbonFiber
  - Si modules: 100  $\mu\text{m}$  Si

## Material Budget

- Beam Pipe: 0.18%  $X/X_0$
- VXD (including support & electr.): 0.8%  $X/X_0$

November 16th, 2008

LCWS08 - C. Gatto

Integrated over  $\phi$

# VXD Single Cluster Residual (single track)

- FNAL/SLAC layout more than adequate for current requirements at ILC
- Main Issue is choice of technology
- Mostly driven by Montecarlo studies on beam background

See F. Ignatov talk  
Wednesday afternoon

ILCRoot simulation

# The 4<sup>th</sup> Concept Drift Chamber

Vessel: 18-150 cm

spherical Endcaps

Active volume: 19-147 cm

# Drift Chamber Layout

Hexagonal cells f.w./s.w.=2:1

cell height:  $1.00 \div 1.20$  cm

cell radius:  $4.5 \div 6.00$  mm

24 superlayers, in 240 rings  
10 cells each (7.5 in average)  
at alternating stereo angles  
 $\pm 72 \div \pm 180$  mrad  
(constant stereo drop = 2 cm)

66000 sense w.  $20 \mu\text{m}$  W

152000 field w.  $80 \mu\text{m}$  Al

“easy” t-to-d  $r(t)$  (few param.)

>90% sampled volume

(max. drift time < 300 ns !)

## Under test

PET Field wires  $25 \mu\text{m}$   
(end plate thickness reduced by a factor 2)

further reduction (30%÷50%) with  
use of Boron loaded Carbon fibers

Boron

Graphite

# CLUster COUnting

MC generated events:  
2cm diam. drift tube  
gain = few  $\times 10$   
gas: 90%He-10%iC<sub>4</sub>H<sub>10</sub>  
no electronics simulated  
vertical arbitrary units

cosmic rays triggered  
by scintillator telescope  
and readout by:  
8 bit, 4 GHz, 2.5 Gsa/s  
digital sampling scope  
through a 1.8 GHz,  $\times 10$   
preamplifier

# Front end VLSI chip

- Integrated  $0.13\mu\text{m}$  CMOS technology provided by UMC though Europractice;
- 3 constitutive blocks:
  - 500MHz bandwidth amplifier with programmable DC-gain;
  - 6-bit@1Gsa/s ADC;
  - 6-bit@1Gsa/s to 30bits@200Msa/s buffer;
- Very low power consumption ( $\sim 40\text{ mW}$ )
- Fully differential architecture

72 chips delivered as of today

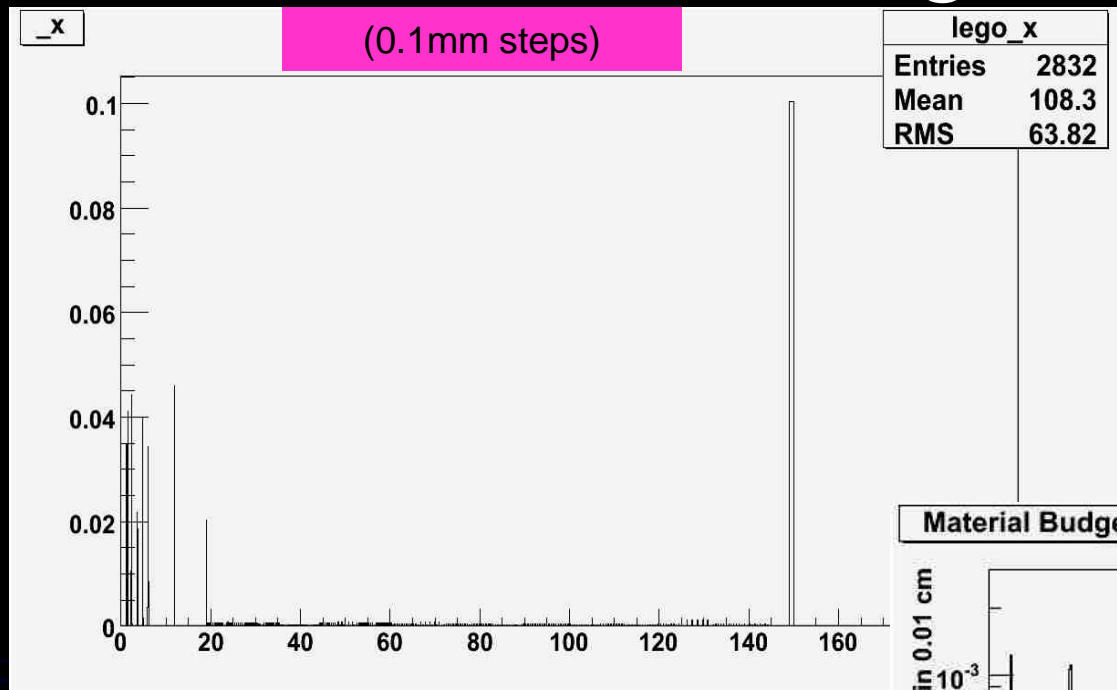

chip microphotography

test board

# Material Budget at $\theta = 90^\circ$

- Gas [He-C<sub>4</sub>H<sub>10</sub>/90-10]: 0.15%
- Wires: 0.4%
- Vessel:
  - Inner wall: 0.1%  $X/X_0$
  - Outer wall: 2%  $X/X_0$
  - Endcaps (wires, pads, electronics & services included): 8%  $X/X_0$

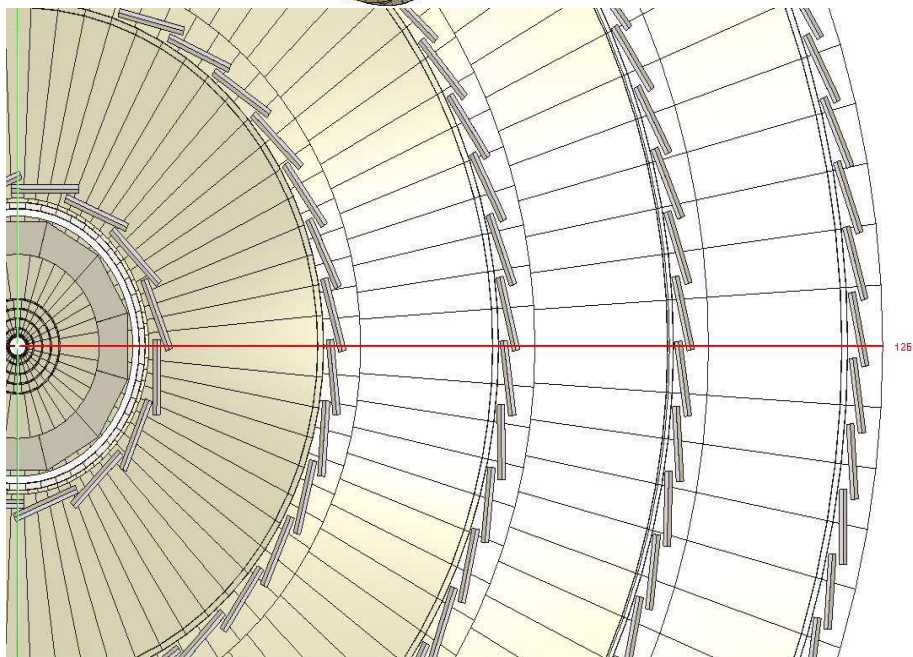

November 16th, 2008

LCWS

Integrated over  $\phi$

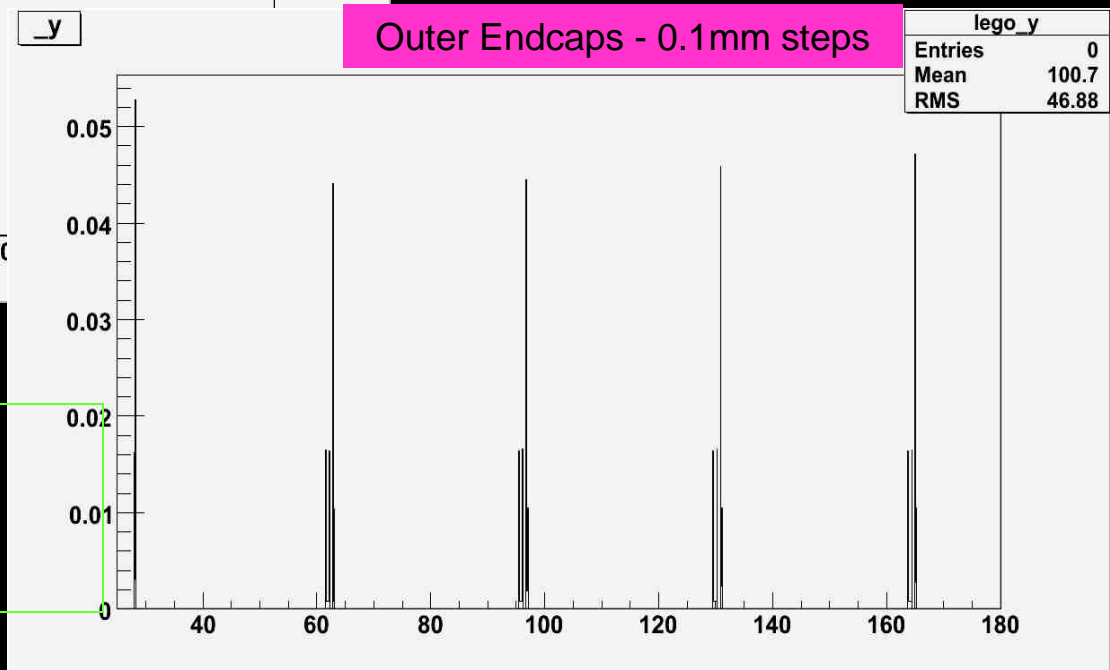

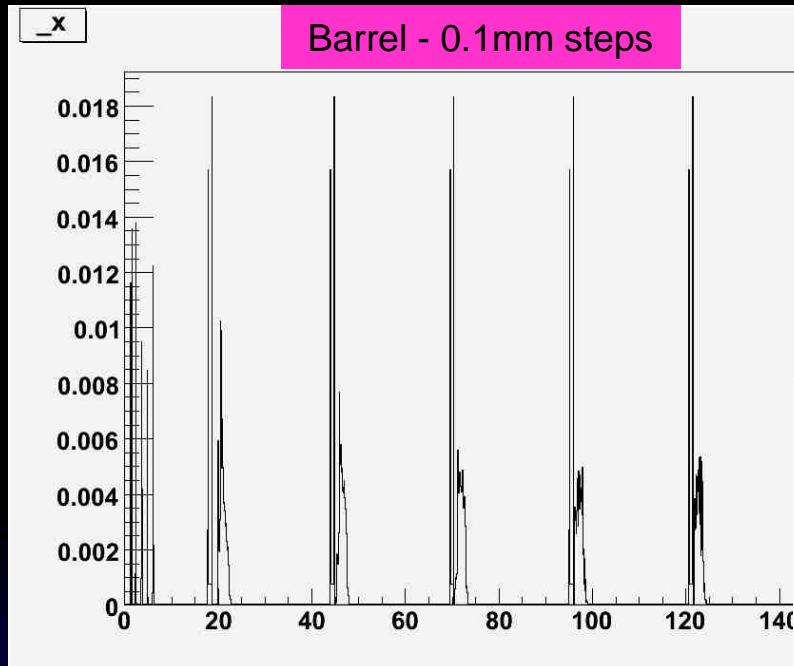

# Tracking Option #1: Si-Strip Tracker

- **Support**
  - Double-walled CF cylinders
  - Allows full azimuthal and longitudinal coverage
- **Barrels**
  - Five layers, 300  $\mu\text{m}$  wafer thickness
  - 25 $\mu\text{m}$  x 10 cm strips
  - Read alternate strips
  - Eighty-fold phi segmentation
  - $r_{\text{in}} = 18\text{cm}$ ;  $r_{\text{out}} = 127\text{cm}$
- **Disks**
  - Four double-disks per end
  - Stereo strips 17.5 mrad
  - Measure R and Phi
  - varying R segmentation
  - Disk radii increase with Z
- **Total strips:  $5.5 \times 10^7$**

# Si-Strip Tracker Material Budget

## Si Strip Tracker

Barrel :6.21% (Si= 3.98% + Support=2.23%)

Endcap Inner Disks: 2.93 %  $X/X_0$

Endcap Outer Disks: 4.39-5.39% (with supports)  $X/X_0$

November 16th, 2008

Integrated over  $\phi$

# Tracking Option #2: Si-Pixel Tracker

- Same layout as Si Strip
- 100 $\mu$ m thickness Si detectors
- 50 $\mu$ m x 50 $\mu$ m pixels
- $\sim (5 \times 10^{10})$  channels

Barrel - 0.1mm steps

## Si Pixel Tracker

- Barrel : 4.8% (Si= 2.6% + Support=2.2%)
- Endcap Inner Disks: 2.22 % X/X<sub>0</sub>
- Endcap Outer Disks: 3.78-4.28% (with supports) X/X<sub>0</sub>

Monday morning

● 40 GeV particles

Cer Energy vs Scint Energy

$(S-C)/(S+C)$

ILCRoot simulation

Hadronic energy  
resolution (fibers)

$E_{\text{dream}}$   $\longrightarrow$

Dual-readout in BGO:  
scintillation and Cerenkov  
lights separated

# The 4<sup>th</sup> Concept Calorimeter

Cu + scintillating fibers + Čerenkov fibers

Fully projective layout

$\sim 1.4^\circ$  aperture angle

$\sim 7.3 \langle \lambda_{\text{int}} \rangle$  (Fibers)

$\sim 8.3 \langle \lambda_{\text{int}} \rangle$  (Crystal+Fibers)

- Azimuth coverage  
down to  $2.8^\circ$
- Barrel: 16384 cells
- Endcaps: 7450 cells

November 16th, 2008

# Hadronic Calorimeter Cells

Prospective  
view of  
clipped cell

Top cell size:  $\sim 8.1 \times 8.1 \text{ cm}^2$

1 mm diameter

Plastic/Quartz fibers

Aperture Number=0.50

(C fibers)

Number of fibers inside each cell:  $\sim 1600$   
equally subdivided between Scintillating and  
Cerenkov

Fiber stepping  $\sim 2 \text{ mm}$

Cell length: 150 cm

Each tower works as two independent towers in the same

volume

Same  
absorber/fiber  
ratio as DREAM

Bottom cell size:  $\sim 4.4 \times 4.4 \text{ cm}^2$

# 4<sup>th</sup> Concept Detector Performance Studies

See also the following talks:

J. Hauptman on Monday morning on Particle ID

F. Ignatov on Tuesday afternoon on tracking with beam background

M. Rucco on Tuesday afternoon on tracking performance

A. Mazzacane on Wednesday afternoon on Performance with jets

V. Di Benedetto on Tuesday morning on Performance of Dual Readout

# 4<sup>th</sup> Concept Software Strategy: ILCroot

- **CERN** architecture (based on **Alice's Aliroot**)
- Full support provided by Brun, Carminati, Ferrari, et al.
- Uses **ROOT** as infrastructure
  - All ROOT tools are available (I/O, graphics, PROOF, data structure, etc)
  - Extremely large community of users/developers
- TGenerator for events generation
- Virtual Geometry Modeler (VGM) for geometry
- Based on **Virtual Montecarlo**
- Could it ever evolve into a general purpose entity for the HEP community (as ROOT)?
- Growing number of experiments have adopted it: Alice, Opera, CMB, (Meg), Panda, 4th Concept
- **Six MDC have proven robustness, reliability and portability**

November 16th, 2008

**Do not Reinvent the wheel**  
**Concentrate on Detector studies and Physics**

# The Virtual Montecarlo Concept

- Virtual MC provides a virtual interface to Monte Carlo
- It allows to run the same user application with all supported Monte Carlo programs
- The concrete Monte Carlo (Geant3, Geant4, Fluka) is selected and loaded at run time
  - Compare Montecarlo performance and possible flows
  - Choose the optimal Montecarlo for the study

November 16th, 200

Perfect Tool for Designing/Optimizing new Detectors

# Detectors in ILCroot

- VTX Detectors: 4<sup>th</sup> Concept, SiD, FTD (from SiLC)
- Central Trackers: TPC, Drift Chamber (3 versions), Si-Strips (SID01), SPT (Pixel Tracker)
- HCAL: DREAM (3 versions)
- ECAL: 4<sup>th</sup> Concept (2 versions)
- Muon Spectrometer: 4th Concept
- **Total: 10 subdetectors (15 versions), most of them with full simulation**

# Event Display in ILCroot

$e^+e^- \rightarrow H^0 H^0 Z^0$   
 $\rightarrow 4 \text{ jets } 2$   
muons  
ECM = 500  
GeV

Low pt secondary  
muon

Single tracks  
No beam bkg

# Tracking Performance

10 muons

New  
Spherical  
EndPlates

Tracking efficiency at low angle  
will improve with addition of Si  
in the fwd regions

## Defining "reconstructable tracks"

- I. DCA(true) < 3.5 cm
- AND
- II. (At least 10 hits in DCH
- OR
- III. At least 4 hits in VTX)

See M. Rucco talk  
Tuesday afternoon

LCWS08 - C

# Comparing Central Trackers Performance

DCH with 3.5 T field  
SID/SIPT with 5 T field

Lower multiple scattering

Theta resolution with P

Lower B field

Single sensors in barrel

See M. Rucco talk  
Tuesday afternoon

# Comparing Central Trackers Performance

DCH with 3.5 T field  
SID/SIPT with 5 T field

Silicon in fwd/bwd region is mandatory

Pixels excels in  $\theta$  reconstruction

See M. Rucco talk  
Tuesday afternoon

## Triple Readout

## hZMass

|                       |                   |
|-----------------------|-------------------|
| Entries               | 828               |
| Mean                  | 88.47             |
| RMS                   | 7.072             |
| $\chi^2 / \text{ndf}$ | 92.15 / 56        |
| Constant              | $39.4 \pm 2.0$    |
| Mean_value            | $89.92 \pm 0.14$  |
| Sigma                 | $3.279 \pm 0.098$ |

$$e^+e^- \rightarrow W^+W^- \nu \bar{\nu}, Z^0 Z^0 \nu \bar{\nu}$$

# W/Z Mass Separation

Dual Readout

- Simple Durham jet-finder a la L3 (fixed/variable ycut) used for this analysis
- No combined information with tracking yet
- 4-jets finding efficiency: 95%

Study by A. Mazzacane

See A. Mazzacane talk  
Wednesday morning

# $e^+e^- \rightarrow Z^0 H^0 \rightarrow \nu \bar{\nu} c \bar{c} + ZZ$ Background

- Signal + ZZ background
- Requires 2 jets from jet-finder
- $E_{\text{vis}} > 130 \text{ GeV}$

- **No flavor tagging**
- Fit with three Gaussians
- Selection Efficiency = 80.2%

# Summary of Detector Studies

- Resolutions with multi-jets are dominated by multiple scattering in VTX + Central Tracker
- Redundancy of measurements and seeding in central tracker is fundamental for good/safe performance
- Small drift cell (drift time  $\leq$  time between BXs) relax the requirements on the VTX
- VTX resolution likely not an issue (for pixels about  $20\ \mu\text{m} \times 20\ \mu\text{m}$ )
- VTX material budget of  $1\% X/X_0$  is OK
- Jet Energy resolution is better than  $30\%/\sqrt{E}$  with Triple Readout Calorimeter
- Constant term is 1.2%
- Dual Solenoid Muon Spectrometer nice complement to Tracking + Calorimeter

# Status of Lol

- Organization of Lol of 4<sup>th</sup> Concept has been finalized
- All tasks have been assigned
- Mass production of events has been planned after ECFA2008 (July 2008)
- Mass production of events started in August.
- All computing resources for the mass production of events are from Fermilab

# Status and Perspectives

- Detector R&D is conducted by independent collaborations (CLUCOU, DREAM, SiLC, SIDET, 3D-Pixels, etc)
- Most critical issues have been pinpointed:
  - DCH needs Si in fwd region: CLUCOU + SiLC (A. Savoy-Navarro, F. Grancagnolo)
  - Crystal Calorimeter: Collaboration with DREAM/Pavia, Fermilab (A. Para)
- Performance of Dual/Triple Readout is very good in data and simulation:
  - need much more work to go from Technique R&D to a Detector design
  - many good ideas on the market (fibers, crystals, fiber-crystals)
  - **It should be an independent, worldwide effort (for future colliders as well)**
- Software framework (ILCroot) runs smoothly at FNAL. It allows quick test of new ideas and efficient optimization work
- It is continuously upgraded, with newer versions of the detectors
- Present effort is for the Letter of Intent (March 2009)
- Personal thanks go to Fermilab for their support and collaboration over the last two years (especially M. Demarteau and B. Tschirhart)

# Resolution for $\pi^0$ in ECAL+HCAL

# ECAL+HCAL Issues

- Preliminary studies on ECAL+HCAL for hadronic showers and jets
- Making ECAL and HCAL working together is not trivial
- Simple merging of the two showers is not working
- Need a more involved calibration
- Otherwise need to give up the crystals or make a purely crystal calorimeter
- Ongoing collaboration with Fermilab on simulation of crystals in ILCroot

# Dual Solenoid B-field & Muon Spectrometer

Magnetic field of dual solenoid and wall of coils

# $\mu$ -System basic element: drift tube

radius 2.3 cm  
 filled with 90% He – 10%  $iC_4H_{10}$  @ NTP  
 gas gain few  $\times 10^5$   
 total drift time 2  $\mu s$   
 primary ionization 13 cluster/cm  $\Rightarrow \approx 20$  electrons/cm total  
 both ends instrumented with:

- > 1.5 GHz bandwidth
- 8 bit fADC
- > 2 Gsa/s sampling rate
- free running memory

for a

- fully efficient timing of primary ionization: **cluster counting**
- accurate measurement of longitudinal position with **charge division**
- particle identification with  **$dN_{cl}/dx$**

ASIC chip  
 under  
 development  
 at INFN-LE
