

# Status of MC Production by Jupiter

Akiya Miyamoto  
KEK  
16-April-2008  
ILD Optimization WG

# Overview

- MC samples by Jupiter have been produced since the end of March
- Produced samples are,
  - ◆ calibration samples:
    - single  $\gamma$ ,  $k0L$ ,  $\mu$ , ... ( Inputs were Jupiter's generator )
    - $uds$ ,  $c\bar{c}$ ,  $b\bar{b}$  samples ( Inputs were pandoraPythia stdhep files.)
  - ◆ Physics processes:  $E_{cm}=250$  GeV, Statistic  $250 \text{ fb}^{-1}$ 
    - $e^+e^- \rightarrow ZH \rightarrow eeH, \mu\mu H, \nu\nu H, qqH$
    - $e^+e^- \rightarrow ZZ \rightarrow eeqq, \mu\mu qq, \nu\nu qq, qqqq, \tau\tau qq$   
(  $qqqq, \tau\tau qq$  are in progress )
    - Generator data of stdhep format were newly created using the beam parameter given by Andrei. Pythia 6.409
- Detector parameters:
  - ◆ 3 parameters: `gldprim_v04`, `gldapr08_14m`, `j4ldc_v04` in parallel.

## Software for ILD studies

(Last update: 14-April-2008: This page was renewed in 1-April-2008)

### Getting started

Please visit [SimTools page](#), [Link to Old GLD Software page](#)

### Generator Data

- [Beam parameters and Beamstrahlung information](#)(bsA)
- [Generator files for ingal samples of ECM=250 GeV](#)

← Generator information

### Simulated Data

- [Data samples of apr08 sequence](#)(Using Release 1.40/1.41 and GLDPrim geometry, etc)

← Simulate data information

### Geometry Information

- [Comparison of geometry parameters](#)(pdf)
- Files comparing geometry parameters: [\(Excel 2007\)](#) [\(html\)](#)
- Material thickness of detector, obtained by a scan in X direction and Z direction: [\(Excel 2007\)](#), [\(html\)](#)
- gldprim\_v04
  - [Geometry data for Jupiter](#)
  - [Radiation Length vs CosTheta up to TPC](#)(png) [Log scale](#)(png) [root macro](#)
  - [Radiation Length vs CosTheta up to the end of EM CAL](#)(png) [root macro](#)
  - [Nuclear Interaction Length up to the end of HD CAL vs CosTheta](#) (png) [root macro](#)
- gldapr08\_14m
  - [Geometry data for Jupiter](#)
  - [Radiation Length vs CosTheta up to TPC](#)(png) [Log scale](#)(png) [root macro](#)
  - [Radiation Length vs CosTheta up to the end of EM CAL](#)(png) [root macro](#)
  - [Nuclear Interaction Length up to the end of HD CAL vs CosTheta](#) (png) [root macro](#)
- j4ldc\_v04
  - [Geometry data for Jupiter](#)
  - [Radiation Length vs CosTheta up to TPC](#)(png) [Log scale](#)(png) [root macro](#)
  - [Radiation Length vs CosTheta up to the end of EM CAL](#)(png) [root macro](#)

# Radiation Length & Nuclear Int. Length

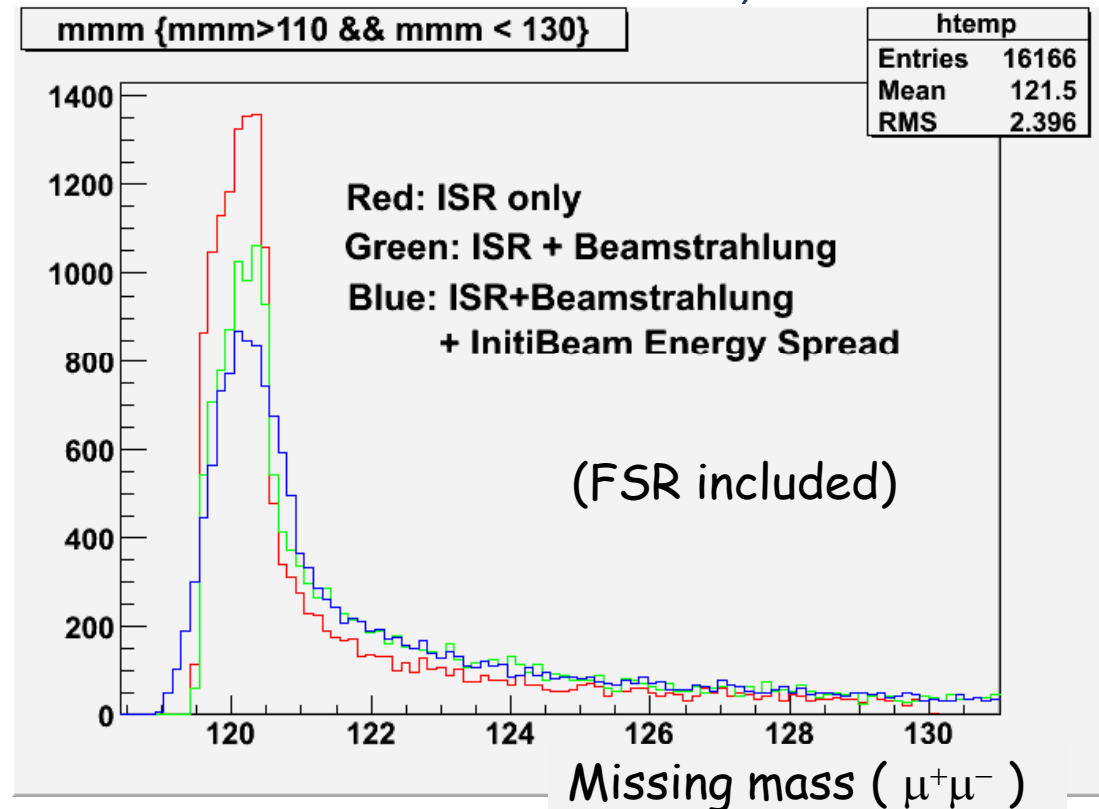

# Generator sample for 250 GeV

- SLAC sample is not ready, so we generated our own at this time.
- BSGEN was used to generate the beamstrahlung spectrum. BSGEN uses a function obtained by a fit to the differential luminosity generated by CAIN using Andrei's beam parameter for 250 GeV. (<http://ilcphys.kek.jp/soft/ILCBeam/BeamParameter.html>)

- Pythia 6.409 was used.
- No beam pol., no Tauola for  $\tau$  decay
- Example of generated events  $\rightarrow$   
Missing mass of  $e^+e^- \rightarrow ZH \rightarrow \mu\mu H$

# Summary of MC Production

GLDPrim\_v04 geometry

Process	#Events /250fb	sec/ events	MB/ events	Total CPU(day)	Total Size(GB)
ZH→eeH	1876	78	2.3	1.7	4.3
ZH→μμH	1876	52	2.2	1.1	4.1
ZH→vvH	11198	51	2.0	6.6	22.4
ZH→qqH	39375	90	3.8	41.0	149.6
ZZ→eeqq	19678	78	2.0	17.8	39.4
ZZ→μμqq	19749	50	1.8	11.4	35.5
ZZ→vvqq	76861	48	1.9	42.7	146.0
ZZ→qqqq	146512	88	3.5	149.2	512.8
Sum				271.5	917.7

← Now in progress

# Next step

---

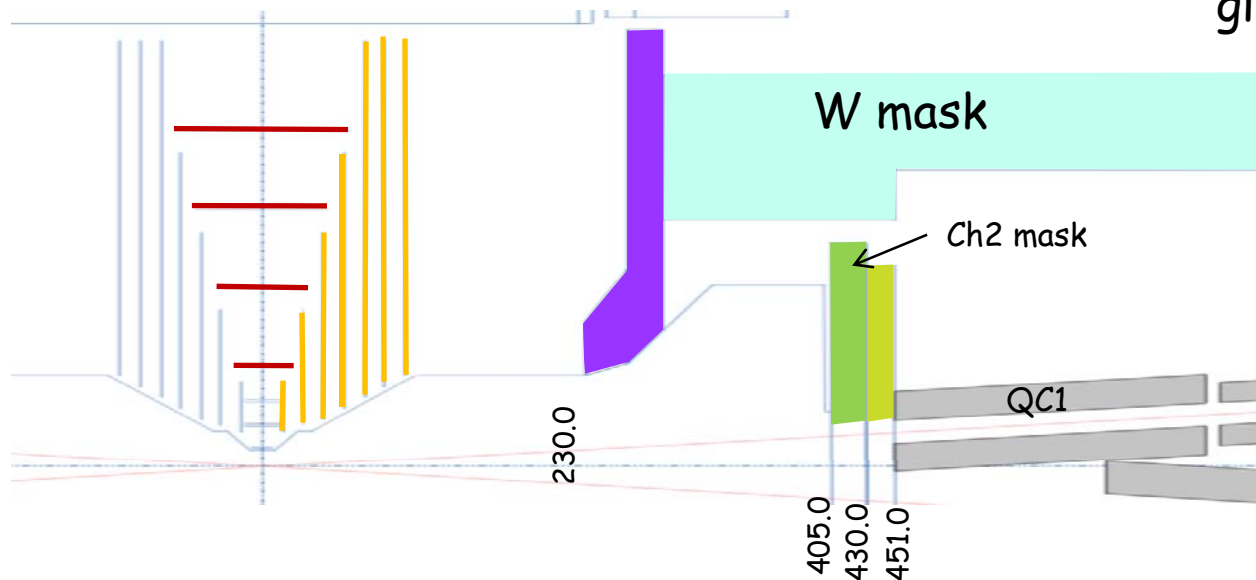

- Study performance using 250 GeV samples
- Produce 500 GeV samples.
  - ◆ SUSY(Chargino, Neutralino, Smuon): Are there StdHep file already ?
  - ◆ ttbar
  - ◆ tautau ( Waiting new stdhep file )
- File management issue.
  - ◆ Simulated files are saved as JSF's root format. They will be converted to LCIO format soon.
  - ◆ They are placed at local disks. Depending on demands, they will be put on GRID SE. But the transfer rate to EU will be several x100kBytes/sec (in the case of the single port transfer).
  - ◆ All generator files in stdhep files will be put on GRID

# IT, FCAL, BCAL, Ch2mask

gldprim\_v04

— Barrel Intermediate Tracker (Si)  
 Rin from 9.0 to 30.0 cm  
 Coverage:  $|\cos\theta| < 0.9$   
 Total thickness: 2.4% R.L.

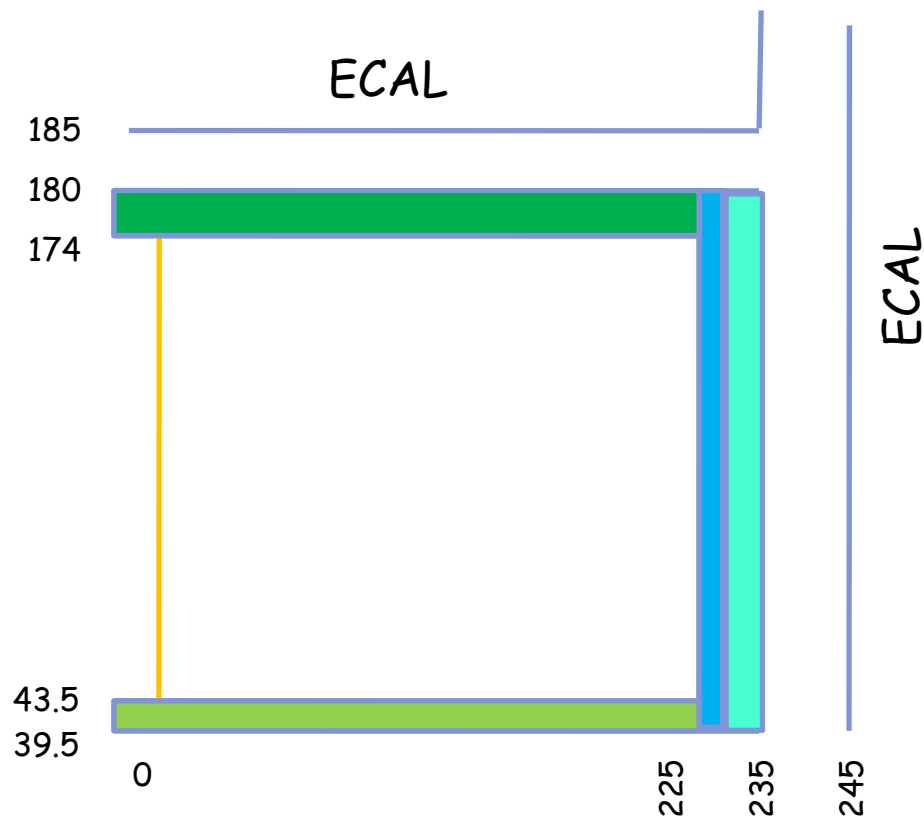

— FCAL:  
 55(45) layers in Front(Tail)  
 Each Layer: Si(0.3mm<sup>+</sup>)+W(3.5mm<sup>+</sup>)+Air

— Endcap Intermediate Tracker (Si)  
 7 layers at Z from 15.5 to 101.5cm  
 Thickness: 0.6%RL/layer

— BCAL:  
 33 layers,  
 Each Layer: Si(0.3mm<sup>+</sup>)+W(3.5mm<sup>+</sup>)+Air

# TPC

gldprim\_v04

TPC

- Central membrane: Mylar,  $250\mu\text{m}^\dagger$
- Pad plane:  $1.955\text{cm}^\dagger$ ,  $0.0853\text{RL}$
- Endcap:  $8.045\text{cm}^\dagger$ ,  $0.0625\text{RL}$
- Inner support:  $4\text{cm}^\dagger$ ,  $0.0198\text{RL}$
- Outer support:  $6\text{cm}^\dagger$ ,  $0.0198\text{RL}$

Drift Region:

Gas: Ar+CF<sub>4</sub>+isoC<sub>4</sub>H<sub>10</sub>(96:3:1)
