

Run Control

- Each subsystem DAQ is started and stopped by the CommonDAQ run control
 - TPC/IP interface, should be rather straight forward to implement
- **Ideal:** Run parameters / DAQ settings are requested by run control and automatically written to LCCD

Problem

- Eudaq does not know about LCIO up to now, but it is being worked on
- Merging raw data to one stream is not very useful. Needs complicated reader which can handle all raw data formats to disentangle data sets
- How to do event building?
- Current status unknown (hepforge server down)
