# Tau and SUSY study in ILD 

Taikan Suehara
ICEPP, The Univ. of Tokyo
Jenny List, Daniela Kaefer DESY, for SUSY study

Thanks to all ILD people for various support.
Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 1

Please read them for details.
Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 2

## Tau-pair analysis

Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 3

## Tau-pair process

Difficulty on decay analysis

$\sigma=2600 \mathrm{fb}^{-1}\left(\mathrm{e}_{\mathrm{L}}^{-} \mathrm{e}_{\mathrm{R}}^{+}\right) \quad \sigma=2000 \mathrm{fb}^{-1}\left(\mathrm{e}^{-}\right.$ $\mathrm{R}^{\mathrm{e}^{+}}$)

$P\left(e^{-}\right)=80 \%, P\left(e^{+}\right)=30 \%, 500 \mathrm{fb}^{-1}$

- $\sigma, A_{F B}$ (bg suppression)
- Polarization P( $\tau)$ $\uparrow$ Decay angle determination

## Data Samples

- Signal events (tau-pair)
- $500 \mathrm{fb}^{-1}$ tau-pair events generated in DESY
- Correct polarization treatment
- $100 \%$ left/right e-/e+ samples.

Event weighting applied for 80/30 polarization.

- SM events (mass production, $\sim 10 \mathrm{M}$ events)
- 20-50 fb-1 ee->2/4/6-jet(+lepton) events
$-0.1 \mathrm{fb}{ }^{-1} \mathrm{r} \gamma / \mathrm{e} \mathrm{\gamma}$ events
- Preselected Bhabha events ( $\sim 1 \mathrm{fb}^{-1}$ )
- Back-to-back (opening angle > 165 deg)
- $|\cos (\theta)|<0.92$
- All ILD_00 geometry

## BG suppression

## BG suppression cuts

- \# Track <=6
- $1(+)+1$ (-) clusters
- Opening angle $>178 \mathrm{deg} \cdot 30<\operatorname{MaxE}(\tau)<240 \mathrm{GeV}$
- $|\cos \theta|_{\tau}<0.9$
- < 2 electrons, $<2$ muons
- $40<\mathrm{E}_{\text {vis }}<450 \mathrm{GeV}$

Purity ~ 90\% (almost bg free)

| Cuts | Tau-pair | Bhabha | $\mu \mu$ | $\mathrm{n} \ell+\mathrm{n} \nu$ | $\gamma \gamma \rightarrow \ell \ell$ | other $\gamma \gamma, \mathrm{e} \gamma$ | other |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| \# tracks, \# clusters | 573140 | $1.24 \mathrm{e}+07$ | 590712 | $1.15 \mathrm{e}+06$ | $1.39 \mathrm{e}+09$ | $4.07 \mathrm{e}+07$ | $1.25 \mathrm{e}+06$ |
| Opening angle $>178$ deg. | 152758 | $7.78 \mathrm{e}+06$ | 157407 | 7938 | $8.41 \mathrm{e}+06$ | 59454 | 2673 |

(b) $e_{R}^{-}(80 \%) e_{L}^{+}(30 \%)$

Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 6

## $\sigma, A_{F B}$

$\sigma: 0.33 \%\left(e_{L}^{-} e^{+}\right), 0.37 \%\left(e_{R}^{-} e^{+}\right)$stat. error (count based)
$A_{\text {FBB }}: 51.64 \pm 0.29 \%\left(e_{L}^{-} e^{+}{ }_{R}\right), 44.18 \pm 0.37 \%\left(e_{R}^{-} \mathrm{e}^{+}\right)$

Right

Green: $\gamma \gamma>\tau \tau$, more events will be processed.
Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 7

## Decay modes in $A_{\text {pol }}$ analysis

## 5 major decay modes

－Leptonic（35．3\％in total）
－「Lepton ID」（high eff．）
－P＝0．22（lost power by 2 vs）
－Pinu decay（10．8\％）
－「only one $\left.\pi^{ \pm}\right\lrcorner$（simplest）
－ $\mathrm{P}=0.58$（full）
－Rhonu decay（23．7\％）

Branching ratio of tau

P＝Sensitivity
M．Davier et al．，PLB306 411 （1993）
－「one $\left.\pi^{ \pm}+2 \gamma\right\lrcorner \quad \mathrm{P}=0.49$（almost full）
－A1nu decay（12．9\％）
－「one $\left.\pi^{ \pm}+4 \mathrm{Y}\right\lrcorner$ or $「$ three $\left.\pi^{ \pm}\right\lrcorner$（each $50 \%$ ）
－ $\mathrm{P}=0.45,3$－prong is useful．

Minimize stat． error by combining decay modes

## Mode selection

- Pure-leptonic decay - lepton ID
- Hadronic decay - composite selection
- \# prongs, \# neutrals
- Lepton veto
- Invariant mass ( $\rho=0.77 \mathrm{GeV}, \mathrm{a}_{1}=1.26 \mathrm{GeV}$ )

Quite complicate cuts:
Details are in backup slides.

## Mode selection - efficiency \& purity

| Mode | Signal | Background | Efficiency | Purity |
| ---: | ---: | ---: | ---: | ---: |
| $\mathrm{e} \nu \nu$ | 32449 | 2374 | $95.2 \%$ | $93.2 \%$ |
| $\mu \nu \nu$ | 30379 | 1694 | $86.1 \%$ | $94.7 \%$ |
| $\pi \nu$ | 19565 | 9021 | $81.7 \%$ | $68.4 \%$ |
| $\rho \nu$ | 39578 | 13604 | $67.2 \%$ | $74.4 \%$ |
| $a_{1} \nu$ (3-prong) | 13802 | 2297 | $78.5 \%$ | $85.7 \%$ |

- > 65\% efficiency and purity are obtained.
- Not yet for a1nu 1-prong mode
- Two issues:
- Lepton ID is degraded in current samples
- More \# of neutrals in PFOs
- Especially in high energy pions
- Pandora is mainly for jets, not for single energetic pion

Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 10

E $\tau \tau>480 \mathrm{GeV},|\cos \quad \theta|<0.9,100 \%$ left e-

MC truth with minimal cuts

Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 11

## A pol calculation ( $\pi v$ mode) (cont.) <br> Comparison of efficiency between left/right pol

Efficiency of cut + reco
(By comparison to MC dist.)

Corrected distribution (80\% right e-)

## Estimation using analyzing power

| Modes | \# events after cut | Sensitivity | Analyzing power |
| :--- | ---: | ---: | ---: |
| $\pi \nu$ | 19565 | 0.58 | 11347 |
| $\ell \nu \nu$ | 62828 | 0.22 | 13822 |
| $\rho \nu$ | 39578 | 0.49 | 19393 |
| $a_{1} \nu$ (3-prong only) | 13802 | 0.45 | 6210 |
| Total |  |  | 50772 |

- Sensitivity: relative value expressing statistical power/event for each process.
- Pinu: 1.5\% stat. error (previous plots)
- Analyzing power is 4.5 times larger if using all modes $\rightarrow$ Total stat. error estimation $=0.7 \%$
- Dedicated analysis of every decay mode are in preparation.

## Summary for Tau

- Backgroud is almost negligible.
- Excellent $\sigma$ and $A_{F B}$ resolution.
- > 65\% purity / efficiency are obtained for polarization analysis of leptonic, pinu, rhonu and a1nu(3-prong) mode.
- Polarization resolution of pinu mode is $1.5 \%$, which can be extrapolated to $0.7 \%$ error by combining all modes.
- Dedicated analysis on rhonu, a1nu and leptonic mode are in preparation.

## SUSY point5

Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 15

## SUSY chi1/ne2-pair process

 SUSY parameters: $m_{0}=206 \mathrm{GeV}, \mathrm{m}_{1 / 2}=293 \mathrm{GeV}$, $\tan \beta=10, \mathrm{~A}=0, \mu=375 \mathrm{GeV}$

Degenerate
$\mathrm{m}\left(\chi^{ \pm}{ }_{1}\right)=16.5 \mathrm{GeV}, \mathrm{m}\left(\chi^{0}{ }_{2}\right)=16.7 \mathrm{GeV}$
$m\left(\chi^{0}{ }_{1}\right)=115.7 \mathrm{GeV}$, Others heavy
100 GeV diff.: decays W/Z + LSP
$\sigma\left(\mathrm{e}^{+} \mathrm{e}^{-} \rightarrow \chi^{+} \chi^{-}{ }_{1}\right)=132.2 \mathrm{fb}$
(>95\%)

- Analysis key: W/Z separation in 4 j environment
- Observables
- Cross section of chargino and neutralino: 1D/2D fit
- SUSY mass determination

## Data Samples

- SUSY point5 signal events generated with whizard (worked by DESY) $-500 \mathrm{fb}^{-1}$ all-SUSY processes in point5
- Another $500 \mathrm{fb}^{-1} \chi^{ \pm} / \chi^{0}$ signal events for template NOTE: $m_{w}=79.8 \mathrm{GeV}$ due to whizard's problem
- SM events (mass production, $\sim 10 \mathrm{M}$ events)
- 20-50 fb-1 ee->2/4/6-jet(+lepton) events
$-0.1 \mathrm{fb}^{-1} \mathrm{r} \gamma / \mathrm{e} \mathrm{\gamma}$ events
- Additional $500 \mathrm{fb}^{-1} \mathrm{ry}$-> WW events
- All ILD_00 geometry

## Cuts for SM suppression

## BG suppression cuts

"qqqq + missing"

- 4-jet clustering (Durham)
- \# Track >= 20
- $100<\mathrm{E}_{\text {vis }}<300 \mathrm{GeV}$
- each $\mathrm{E}_{\mathrm{jet}}>5 \mathrm{GeV}$
- $|\cos \theta|_{\text {jet }}<0.99$
- unlike 3jet $\left(y_{\mathrm{th}, 3}>0.001\right)$
- each jet has >= 2tracks
- $|\cos \theta|_{\text {miss }}<0.99$
- no > 25 GeV leptons

Loose cut (efficiency ~ 90\%)

Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 18

## Kinematic fit \& Jet pairing

- MarlinKinFit processor
- (Essential) free parameters: Energy and opening angle for each jet(-pair)... NDF=6
- Constraints:
- Two di-jet masses are the same - 1C fit
- Two di-jet masses are $m_{w} / m_{z}-2 C$ fit (W/Z)
- Implemented in Desy (J.List et al) and shared
- Jet pairing
- All pair
$\begin{aligned}-\chi_{W}^{2}\left(m_{1}, m_{2}\right) & =\frac{\left(m_{1}-m_{W}\right)^{2}+\left(m_{2}-m_{W}\right)^{2}}{\sigma^{2}} \\ x_{Z}^{2}\left(m_{1}, m_{2}\right) & =\frac{\left(m_{1}-m_{Z}\right)^{2}+\left(m_{2}-m_{Z}\right)^{2}}{\sigma^{2}}\end{aligned}$
- Best kinematic fit

| Obs. | KinFit | Pairing |
| :--- | :--- | :--- |
| $\sigma(1 D$ fit $)$ | 1C | KinFit |
| $\sigma(2 D$ fit $)$ | No | All |
| mass | 2 C | $\chi^{2} /$ KinFit |

## Cross section - 1D fit (1)

## Additional cuts

|  | ch1 had | ne2 had | other SUSY | SM gg | SM 6f | SM 4f | SM2f |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $E_{1}<25$ | 25123 | 4981 | 6463 | 23133 | 14407 | 154927 | 3534 |
| $N_{\text {PFO }}>3$ | 25029 | 4975 | 6103 | 23014 | 13696 | 139429 | 3518 |
| $\left\|\cos \theta_{\text {pmiss }}\right\|<0.8$ | 20144 | 4079 | 5180 | 681 | 9950 | 62668 | 529 |

| kin. fit converged | 20085 | 4068 | 4999 | 626 | 3649 | 44577 | 341 |

- Additional cuts

## Mass spectrum

- 1C kinematic fit
- Pairing selection by the kinematic fit
gives good separation of W/Z peaks.

## Cross section - 1D fit (2)

Cross section fitting procedure:

- SM background
$2^{\text {nd }}$ polynomial fitting separately
- SUSY + SM
- Gaussian + BW for each W/Z
- Width and center value fixed, normalization is the only free parameters
- SM $2^{\text {nd }}$ polynomial fixed

Fit result ( $\sigma$ resolution):
$0.95 \%$ for $\chi^{ \pm}, 2.9 \%$ for $\chi^{0}{ }_{2}$.
Resolution is a little worse, but less MC info required than 2D fit.

## Cross section - 2D fit

$\uparrow$ SM background

$\uparrow$ Fit result
$\downarrow \chi^{ \pm}$template $\uparrow$ all events Procedure

1. Make di-jet-mass-pair distribution.
2. SM background is subtracted considering statistical fluctuation.
3. $\chi^{ \pm}$and $\chi^{0}$ distributions are created from independent samples (templates).
4. Fit normalization factor for templates.

## $\leftarrow \chi^{0}$ template <br> $\chi^{ \pm}: 0.64 \%$ resolution <br> $\chi^{0}: 2.1 \%$ resolution

## W/Z separation for mass fit

$$
\begin{aligned}
\chi_{W}^{2}\left(m_{1}, m_{2}\right) & =\frac{\left(m_{1}-m_{W}\right)^{2}+\left(m_{2}-m_{W}\right)^{2}}{\sigma^{2}} \\
\chi_{Z}^{2}\left(m_{1}, m_{2}\right) & =\frac{\left(m_{1}-m_{Z}\right)^{2}+\left(m_{2}-m_{Z}\right)^{2}}{\sigma^{2}}
\end{aligned}
$$

- $\chi_{W}^{2}<4$ for $\tilde{\chi}_{1}^{ \pm}$mass fit.
- $\chi_{W}^{2}>4 \& \chi_{Z}^{2}<4$ for $\tilde{\chi}_{2}^{0}$ mass fit.

Chargino selection (no SM)

Neutralino selection (no SM)

Taikan Suehara et al., TILC09 in Tsukuba, 2009/04/18 page 23

## Mass fit procedures

## Procedure

1. 2 C Kinematic fit after W/Z separation
$\rightarrow$ upper plots
2. SM background parametrization $2^{\text {nd }}$ polynomial x Gaussian $\rightarrow$ left plot

## Mass fit procedures (2)

Procedure (cont.)
3. Create SM distribution by toy-MC.
4. SUSY+SM fit (8 free param.)

Convolution of $2^{\text {nd }}$ pol. \& Voigt func. + SM(fixed) integration range of convolution represents edges.
5. Mass calculation by kinematics.

W low edge is just at $m_{w}$ (no info for masses).
Other 3 edges are used for the calculation.

## Result and comments for the fit

Edge position resolution
W low: $0.07 \mathrm{GeV}, \mathrm{W}$ high: 0.62 GeV $Z$ low: $0.23 \mathrm{GeV}, Z$ high: 0.71 GeV

Gaugino masses

$$
\begin{aligned}
& m\left(\chi^{ \pm}\right)=221.7 \pm 2.4 \mathrm{GeV} \\
& \mathrm{~m}\left(\chi^{0}{ }_{2}\right)=219.9 \pm 0.9 \mathrm{GeV} \\
& \mathrm{~m}\left(\chi_{1}^{0}\right)=118.5 \pm 0.8 \mathrm{GeV}
\end{aligned}
$$

- All SUSY masses are float at the fit.

Correlation between SUSY masses is included.

- Edge positions are only used for mass determination.
- Cross section dependence on SUSY masses is not used because it should have model uncertainty.
- $2^{\text {nd }}$ pol and Voigt width are also not fixed.
- Error on $\chi^{ \pm}$mass is large.
- Since W low edge cannot be used, LSP mass error on $\chi^{0}{ }_{2}$ fit is propagated to $\chi^{ \pm}$mass error.

## Summary for SUSY-point5

- ILD has sufficient power to separate chargino/neutralino events in point5 SUSY.
- < $1 \%\left(\chi^{ \pm}\right)$and $2-3 \%\left(\chi^{0}\right)$ pair production cross section resolution is obtained.
- With 2C kinematic fit, < $1 \mathrm{GeV}\left(\chi^{0}{ }_{2}\right)$ and 2.4 $\mathrm{GeV}\left(\chi^{ \pm}\right)$mass resolution is obtained.
- Although mass fit includes some conservative assumptions, it should be a good first estimate of real analyses.
- Of course having a room to improve analysis...
