

Status of RPC based DHCAL

H. Weerts, Argonne Nat. Lab.

for

DHCAL RPC group

CALICE
Calorimeter for ILC

U.S. Department
of Energy

UChicago ►
Argonne_{LLC}

Outline

Vertical Slice Test-- Intro

RPC characteristics

Performance

- Rate capability

- Positron showers

- Pion data

- Environmental dependence

Future

Conclusions

Vertical Slice Test

Test of whole system with

Up to 10 RPCs, each $20 \times 20 \text{ cm}^2$
(Up to 2560 channels)

RPCs

Up to 9 two-glass designs

1 one-glass design

Only use RPC0 - RPC5 in analysis of e^+ , π^+

Only use RPC0 - RPC3 for rate dependence

Two-glass design

One-glass ('exotic') design

Vertical Slice Test

Test of whole system with

Up to 10 RPCs, each 20 x 20 cm²
(Up to 2560 channels)

RPCs

Up to 9 two-glass designs
1 one-glass design
Only use RPC0 – RPC5 in analysis of e^+ , π^+
Only use RPC0 – RPC3 for rate dependence

Absorber

For cosmic rays, muon, pions, electrons: Steel (16 mm) + Copper (4 mm)

Rate capability measurement (120 GeV protons): 16 mm PVC with whole cut out in center

Test beam

Collected data in Fermilab's MT6 beam line

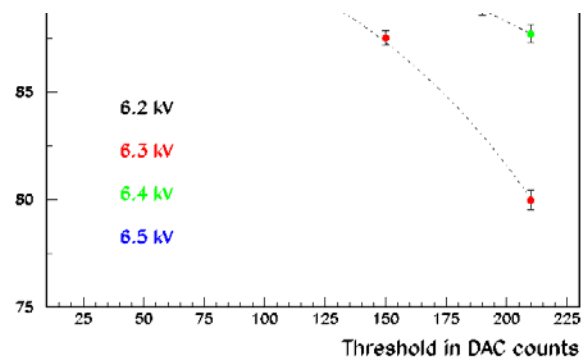

Cosmic Rays

Collected data for ~18 months

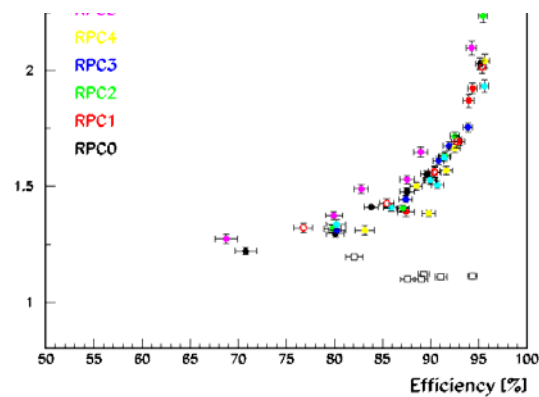

Slice of a
“complete”
system

RPC performance

Operation:
HV: 6.0-6.3KV
Threshold: 110
Effic. ~90%

RPC performance

Operation:
HV: 6.0-6.3KV
Threshold: 110
Effic: 90-95%

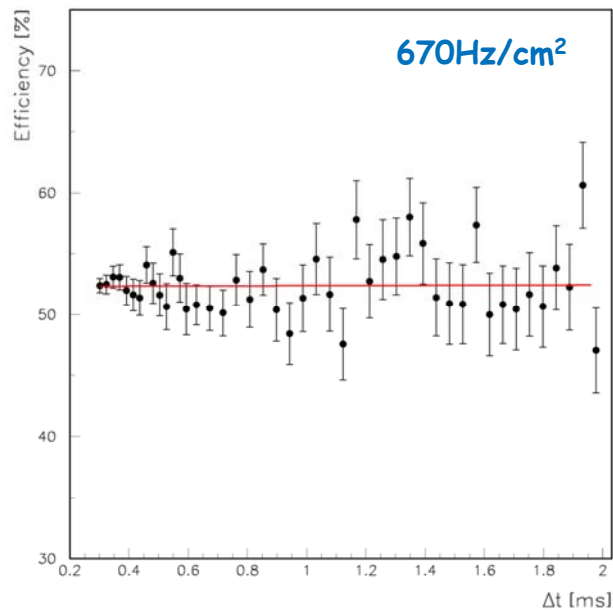

Fits theoretically motivated

Rate Capability

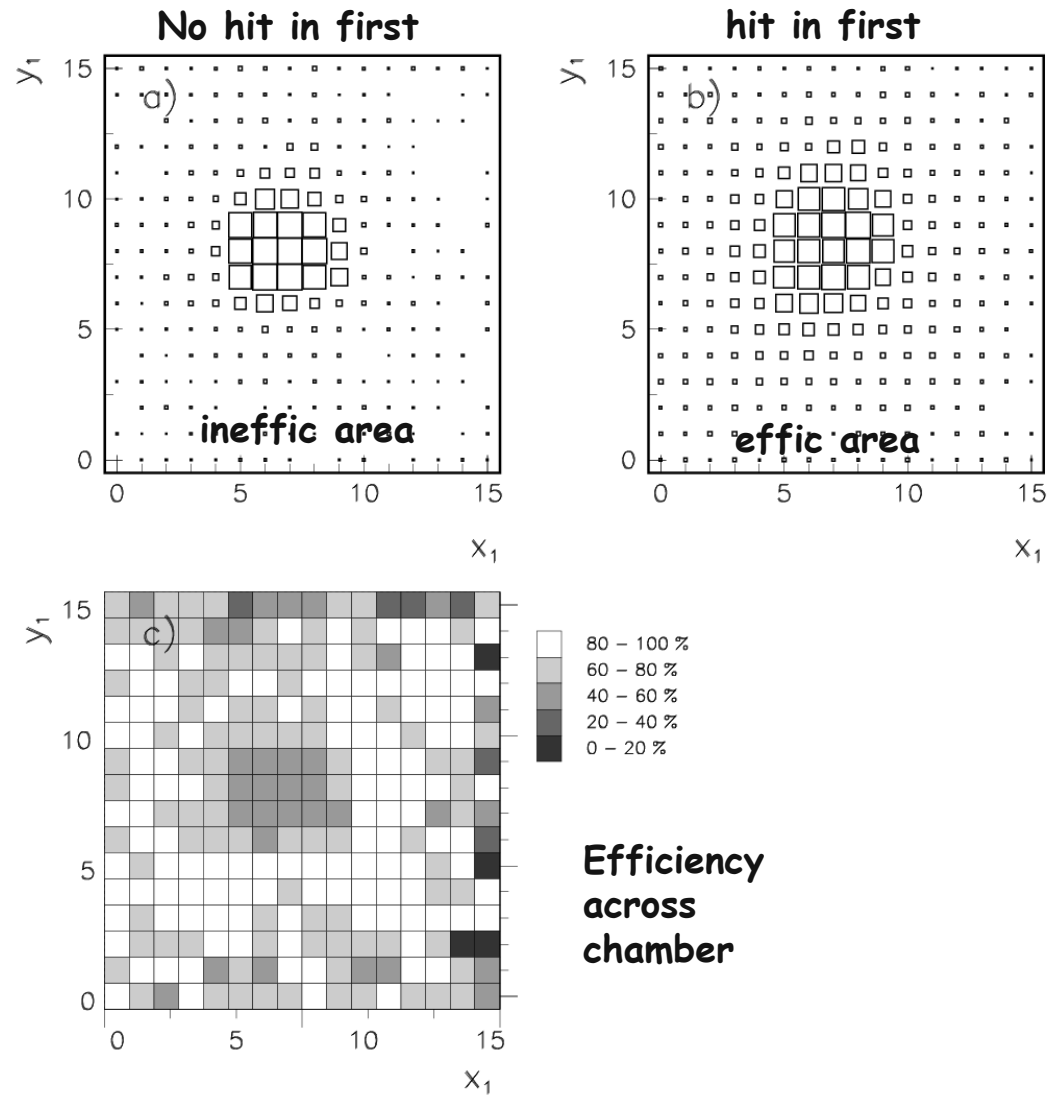

Δt between two protons

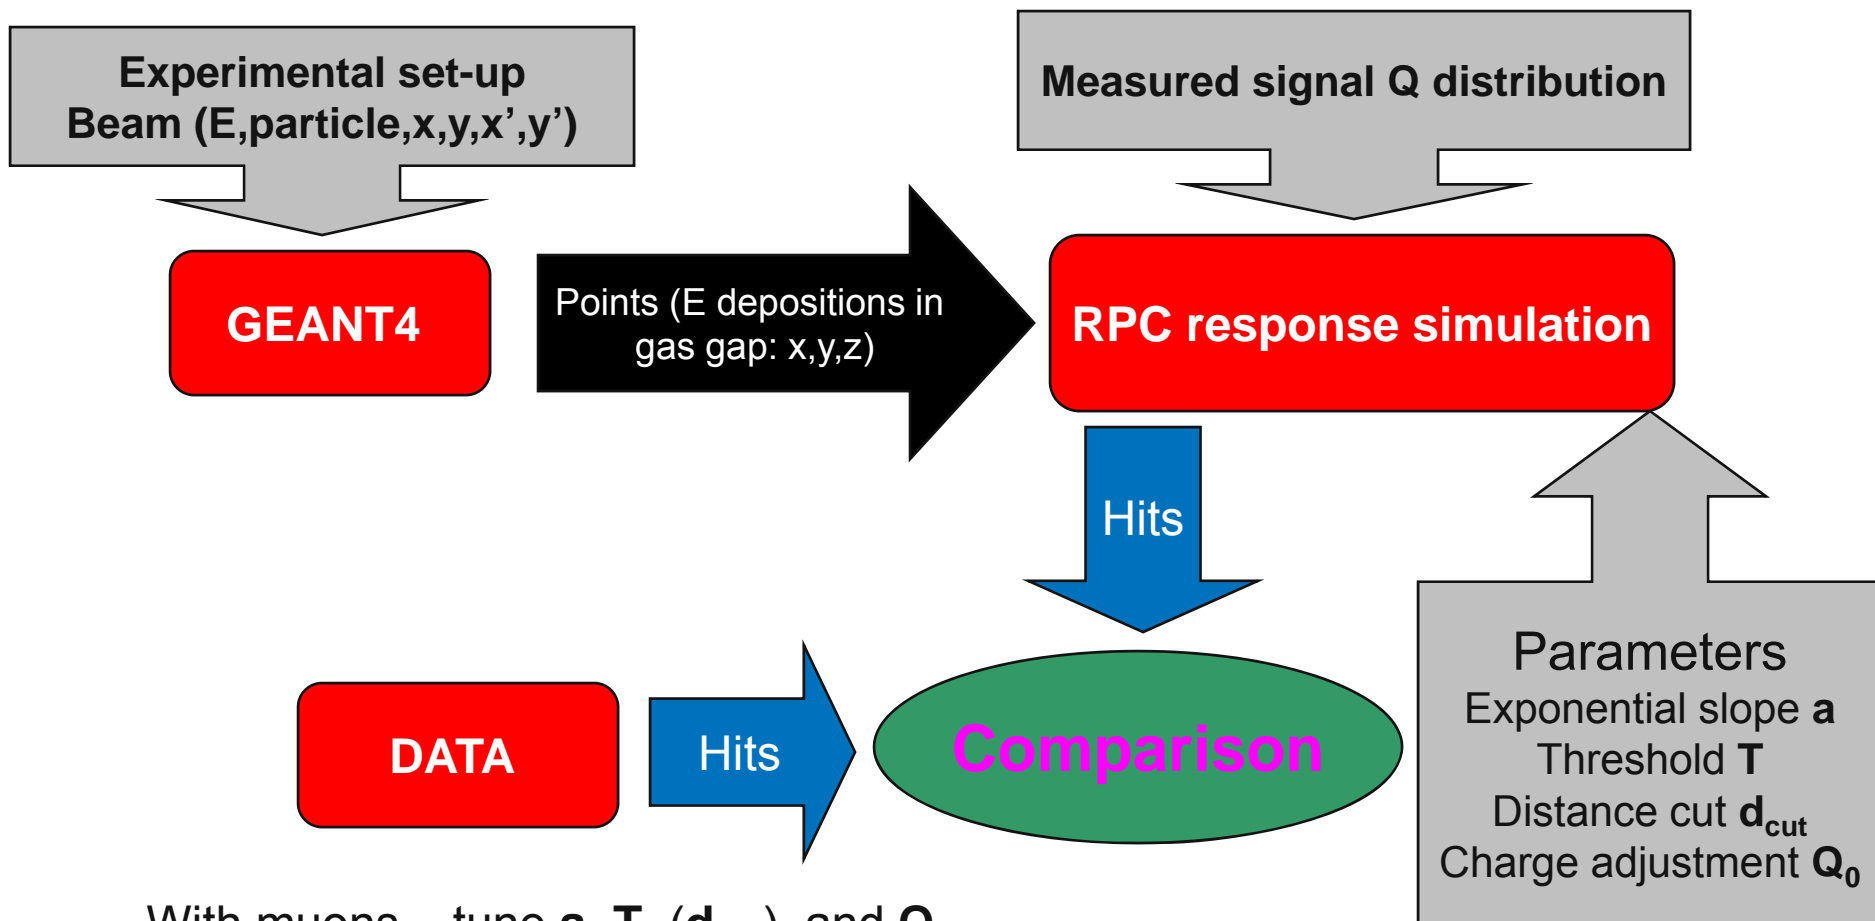

Time between consecutive events

Two chambers: position of hit in 2nd chamber

1800Hz/cm²

Simulation Strategy and comparison to test beam data

With muons – tune a , T , (d_{cut}), and Q_0
With positrons – tune d_{cut}
Pions – no additional tuning

Broadband μ

Monte Carlo simulations

2GeV e^+

Positron Showers

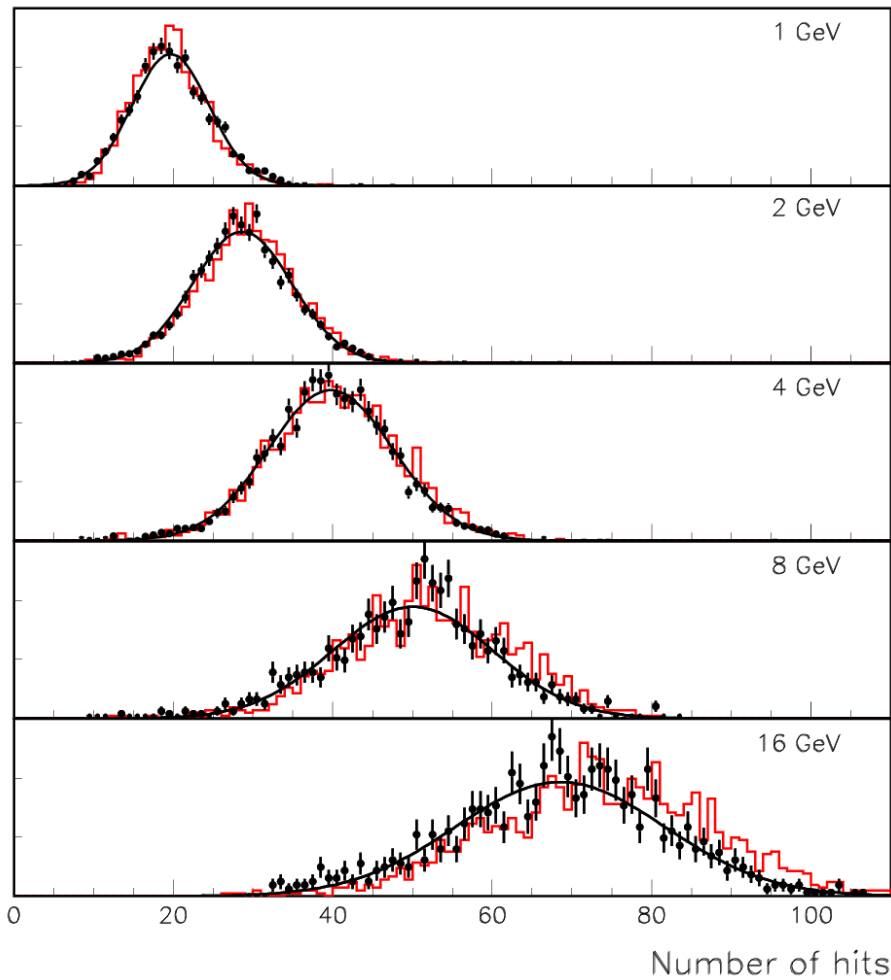

8 GeV e^+

Positron Showers

Monte Carlo simulations - 6 layers
Monte Carlo simulations - Infinite stack

Response to Pions

Simulation needs to be redone with tuned parameters...

Data at

1, 2, 4, 8, 16 GeV (electrons rejected by Čerenkov)

6 layer stack corresponding to $0.7 \lambda_1$

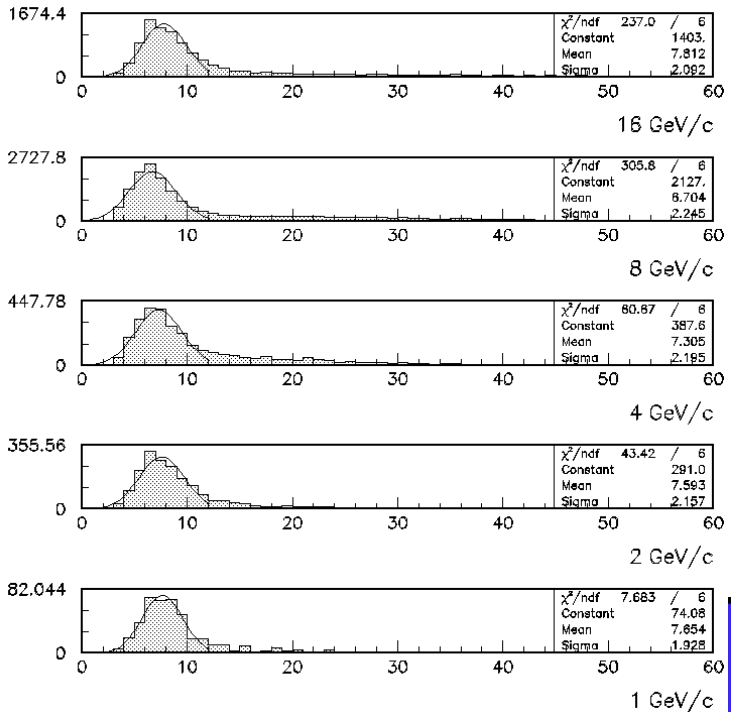

Analysis separates

- Non-interacting pions/muons
- Pions interacting in first layers
- Pions interacting later (rejected)

Exactly one cluster in first layer
Distance $R < 5$
Number of hits in **first** layer < 5

MIP selection

Number of hits in **second** layer < 5

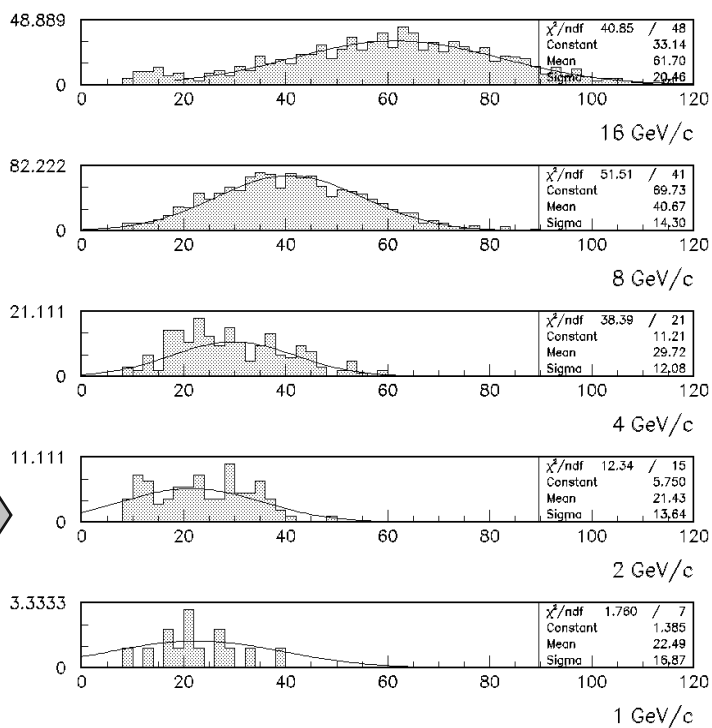

Plot total #hits

Nice MIP peaks

Gaussian distributions

Pion selection

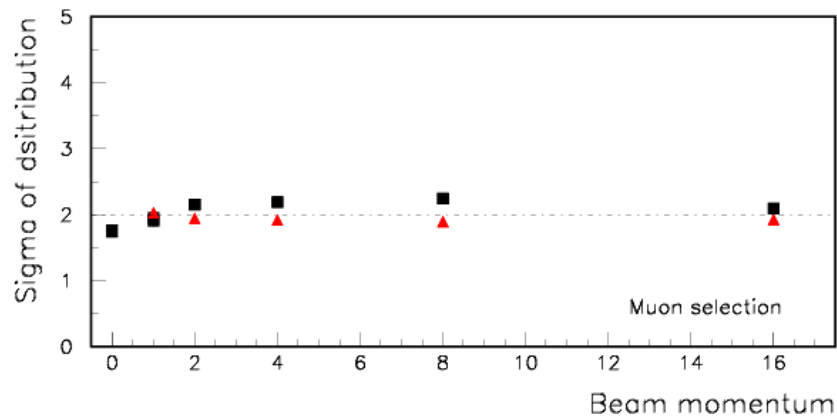

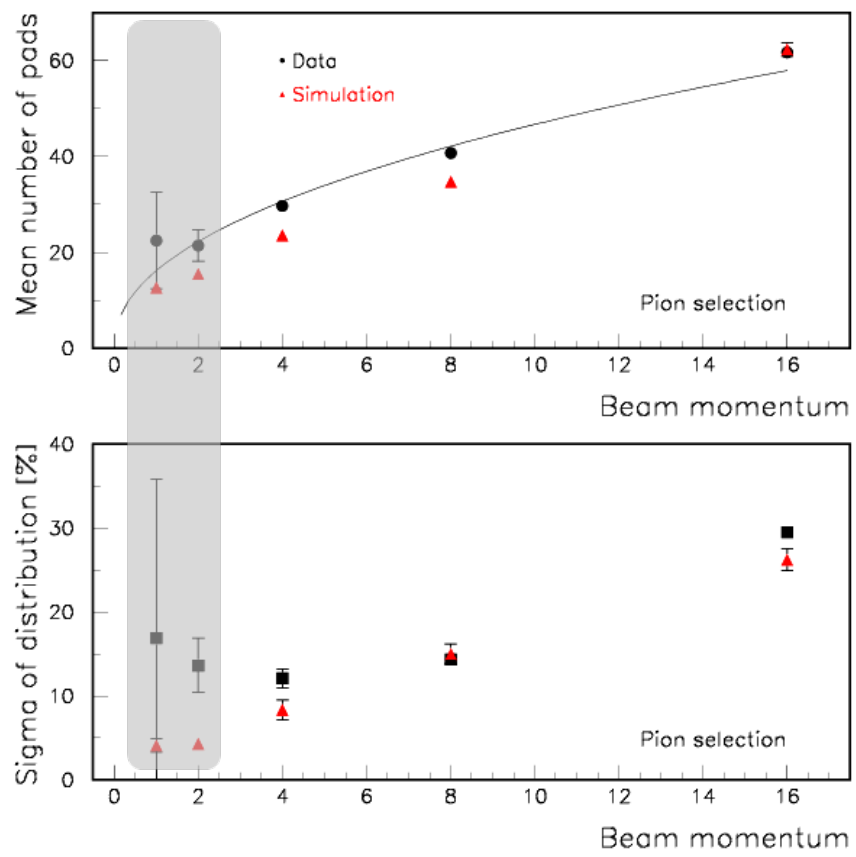

Number of hits in **second** layer ≥ 5

Response to Pions

MIP selection

Mean and sigma ~independent of beam momentum
Mean not very well reproduced by simulation
→ Beam contains muons, simulation does not
(data are cleaner !!!)
Width of distributions adequately reproduced

Pion selection

Measurements at 16, 8 and 4 GeV/c
Not sufficient statistics at 2, 1 GeV/c
Non-linearity due to leakage
Adequate agreement with simulation

Environmental

Noise Rate(Uncorrected Data)

Data collected over period of 18 months

Weather station added about 9 months ago

Barometric pressure
Ambient temperature
Air humidity

Efficiency (Uncorrected Data)

Multiplicity (Uncorrected Data)

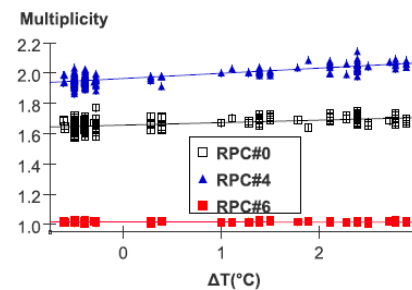

Noise Rate Vs. $\Delta T(-22.5^\circ\text{C})@100\text{kpa}$

Efficiency Vs. $\Delta T(-22.5^\circ\text{C})@100\text{kpa}$

Multiplicity Vs. $\Delta T(-22.5^\circ\text{C})@100\text{kpa}$

Noise Rate Vs. $\Delta P(-97.3\text{kpa})@22.5^\circ\text{C}$

Efficiency Vs. $\Delta P(-97.3\text{kpa})@22.5^\circ\text{C}$

Multiplicity Vs. $\Delta P(-97.3\text{kpa})@22.5^\circ\text{C}$

Assume linear dependence on p,T,H

$$F_i(p,T,H) = F_{i,0} + b_{i,1} \Delta p + b_{i,2} \Delta T + b_{i,3} \Delta H \quad \text{with } i = N,E,M$$

Apply correction \rightarrow check RMS of distributions

RMS Comparison (Noise Rate)

RMS Comparison (Efficiency)

RMS Comparison (Multiplicity)

Bonus: performance versus gas flow rate

Description

40 layers each $\sim 1 \times 1 \text{ m}^2$

Each layer with 3 RPCs, each $32 \times 96 \text{ cm}^2$

Readout of $1 \times 1 \text{ cm}^2$ pads with one threshold (1-bit)

$\sim 400,000$ readout channels

Layers to be inserted into the existing AHCAL CALICE structure

Purpose

Validate DHCAL concept

Gain experience running large RPC system

Measure contained hadronic showers in great detail

Validate hadronic shower models

Status

Started construction in fall 2008

DCAL III chip

Produced in 2008

Received 11 wafers with 966 chips each → 10626 chips

→ Packaged chips by early March--done

Testing to be done

'by hand' at Argonne for first chips (in progress)

by robot at FNAL (being programmed)

Pad- and Front-end board

On critical path

$32 \times 48 \text{ cm}^2 \rightarrow 4 \times 6$ chips

Being designed (first prototype in hand)

Data concentrator

Design and firmware completed

To be implemented onto front-end board

Item	Status	Outstanding problems/tasks	Critical path
RPC construction	Several prototypes exist	Test of thin-glass 2-glass chambers Test of full-scale 1-glass chambers (requires final front-end board) Develop production procedure	No
DCAL chips	In hand	Robot testing	Until ~May
Front-end boards	Being prototyped	Final design/prototype (ASIC in hand) Testing procedure being developed	~May - October
Back-end	Being produced	Small modifications to existing design	No
Gas system	Being assembled	None	No
HV system	Completed	None	No
DAQ software	Being modified	None	No
OFFLINE software	Being developed	None	No

Conclusions

Learned a lot from vertical slice test and extended operation of chamber stack

Excellent foundation for next step

Building planes/electronics/DAQ for 1m^3 test calorimeter to go into CALICE stack
