

Silicon tracking system for ILD: integration

A. Savoy-Navarro, LPNHE/CNRS-IN2P3

The Silicon envelope (JE Augustin, M. Berggren, ASN)

(by M. Valentan, LicToy)

The silicon envelope or tracking hermeticity

MOKKA simulation
of Si envelope

The Full Silicon tracking system:
 Barrel: SIT+SET (3 2D-layers total)
 Forward: FTD+ETD
 Is included in MOKKA framework
 by V. Saveliev

ILD Silicon tracking: the barrel components

Simulation ILCRoot (A. Charpy)

Calorimeter shape

ILD Silicon tracking: the forward components

ETD: XUV design instead of projective (LPNHE)

Very preliminary mechanical design

Main integration challenge

All-Silicon tracking system:
fully integrated system =>
Much more easy to integrate.

Compared to an all Silicon tracking system (see SiD design for instance)
The ILD Silicon tracking system is much more challenging in terms of integration
as it is an hybrid system: gaseous + Silicon and each component is in a LINK
region between 2 (at least) sub-detectors.
Thus the SiLC collaboration which is working on this system has to address each
case separatly this work is undergoing ad we are briefly summarizing here the
present status.

Some important features:

- The FEE readout electronics prove to give:
1mWatt per channel and is power cycled (factor: 70:1) =>
NO COOLING

The strips sensors will be edgeless technology, thus a “flat structure”.

- The FEE readout will be on detector (bump bonding first then 3D vertical interconnect): high multiplexing in the FEE electronics architecture and NO FE-boards
- The processed data are daisy chained (microcoax) on the detector and the sent outside with digital fibers to the outside of the detector (CR)

Level 2: FE-on detector edges, interface detector with external world

Example

Cabling:

Level 1 to Level 2: microcoax
Level 2 to Level 3: digital
fibers

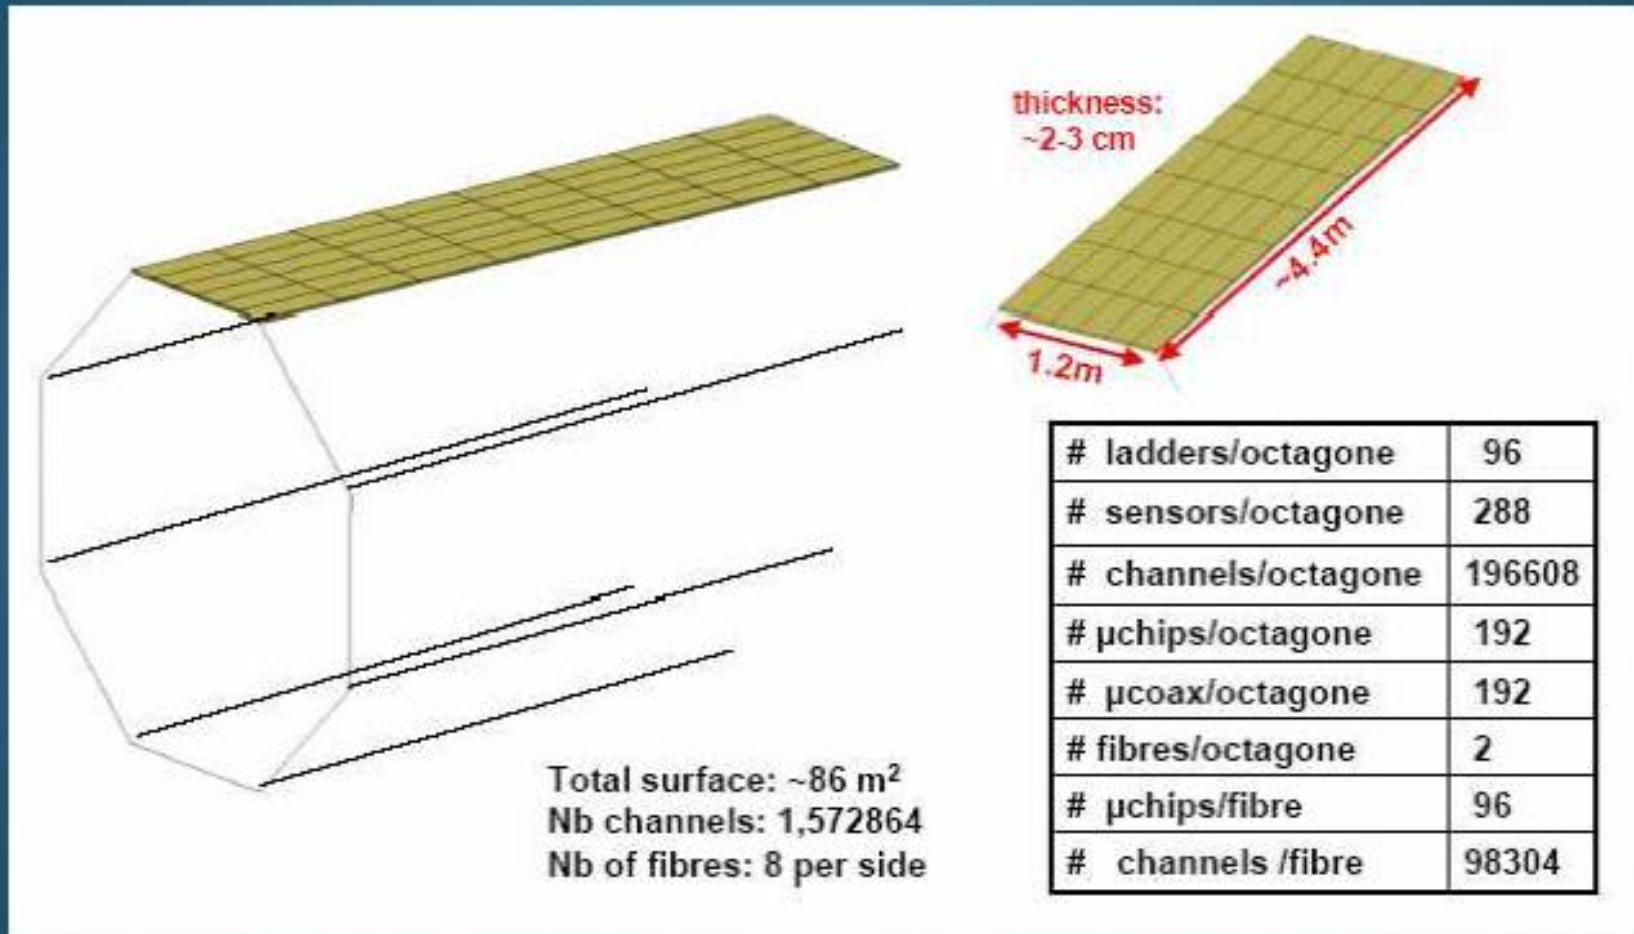

Number of issues related to cabling:

Follow industrial advances
High rates and high speed,
reliability, fault tolerance,
robustness

Common for all sub
detectors

Each red points = buffer + pre-processing 2 (re-ordering & compressing data), transceiver (digital fiber to external world = Control Room)
Sends pre-digested data at CR and get slow control and distributes it on detector

Just an example

Outer Silicon tracking layer : false double sided sensors

The SET detector integratio

Preliminary Mechanical Structure of the SET Detector

- FEM studies of different lay-outs of SET mechanical structure;
- Production & Integration issues

- SET fixed on TPC

- Targets:
 - Good rigidity of the support structure;
 - Low XO [%] for structural elements.

Preliminary Mechanical Structure of the SET Detector

BASIC STRUCTURAL ELEMENT

- sandwich panel
 - 4 High Module UD Carbon-Epoxy 0,16 mm (0,64 mm) prepreg plies per side
 - 15 mm Rohacell 31 core (PMI) polymethacrylimide rigid foam;
 - approx. 2,5 kg/m²

MATERIAL BUDGET

0,24 X0 [%] 4 UD C plies
0,135 X0 [%] 15 mm ROHACELL
0,24 X0 [%] 4 UD C plies

TOTAL 0,615 X0 [%]

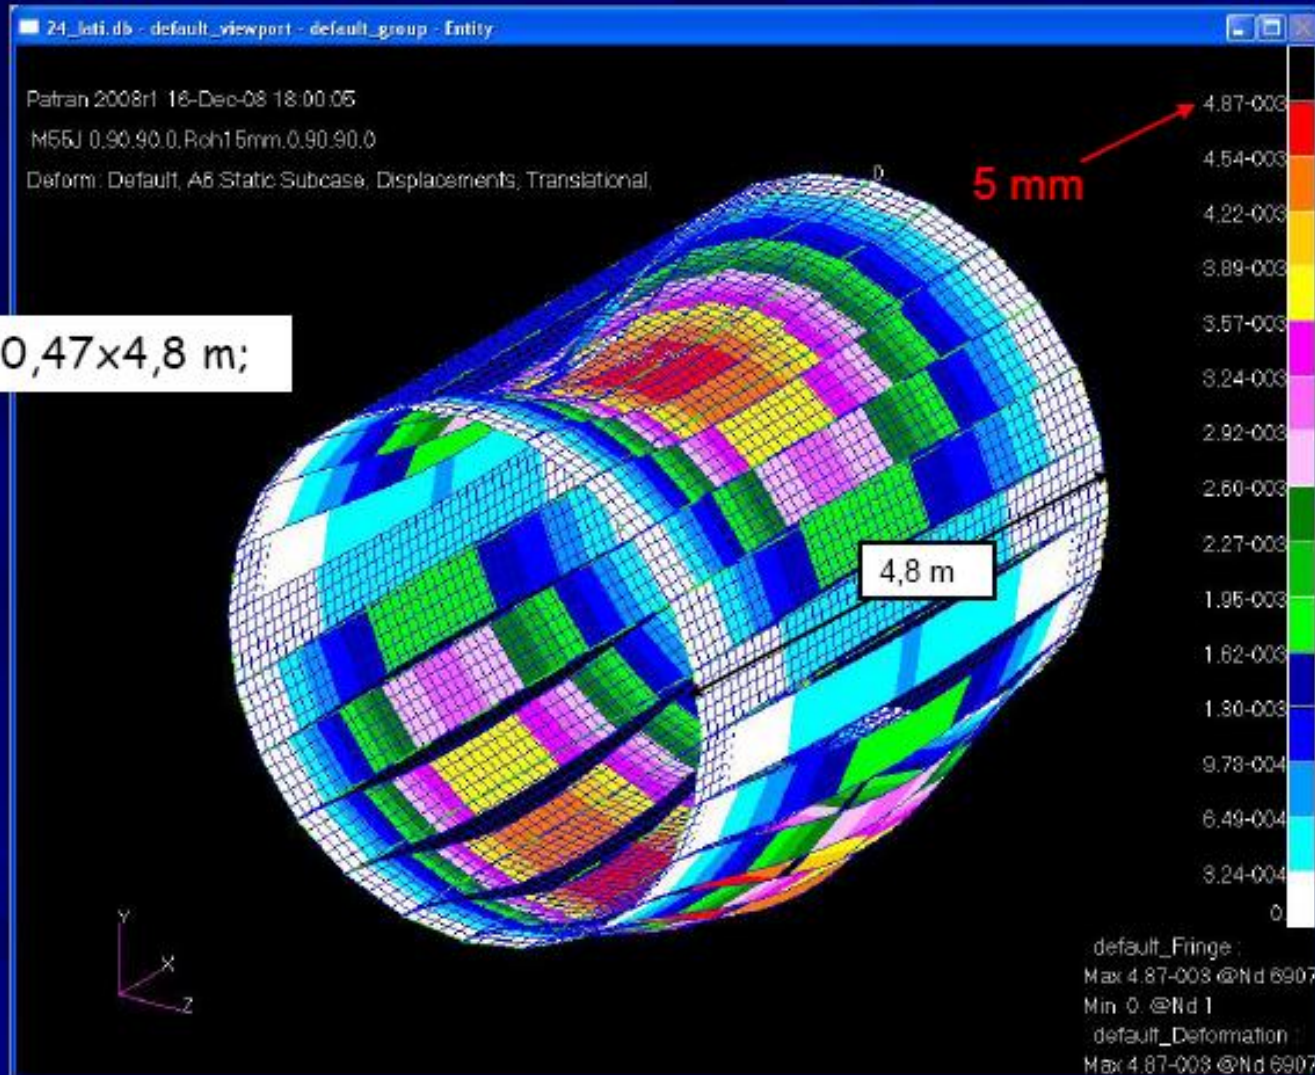

Preliminary Mechanical Structure of the SET Detector

SET in ILD_00 model

Preliminary Mechanical Structure of the SET Detector

Preliminary Mechanical Structure of the SET Detector

CFRE: Carbon Fiber Reinforced Epoxy

Si support element

CFRE mid-plane support ring

CFRE end-cap support ring

CFRE longitudinal element

Flat panel solution

- min deformation 0,4 mm;
- 2,4 meter-long sandwich panels;
- modularity: very good for production, Si positioning, assembly and maintenance;
- three fixation discs on TPC needed;
- more panels, better solution...

ILD's tracking performance (in the barrel region)

and the effect of the silicon envelope

Tracking performance in the barrel region of the present ILD setup, in terms of

- Momentum resolution $\sigma \left(\frac{\Delta p_T}{p_T^2} \right)$
- Projected impact parameter resolution $\sigma(ip2)$
- z resolution $\sigma(z)$
- evaluated at the inner side of the beamtube
- with LiC Detector Toy 2.0

Tracking performance as function of p_T , at $\vartheta = 90^\circ$

(Evaluation at the inner side of the beamtube)

The FTD integration case

Inner Detector Support

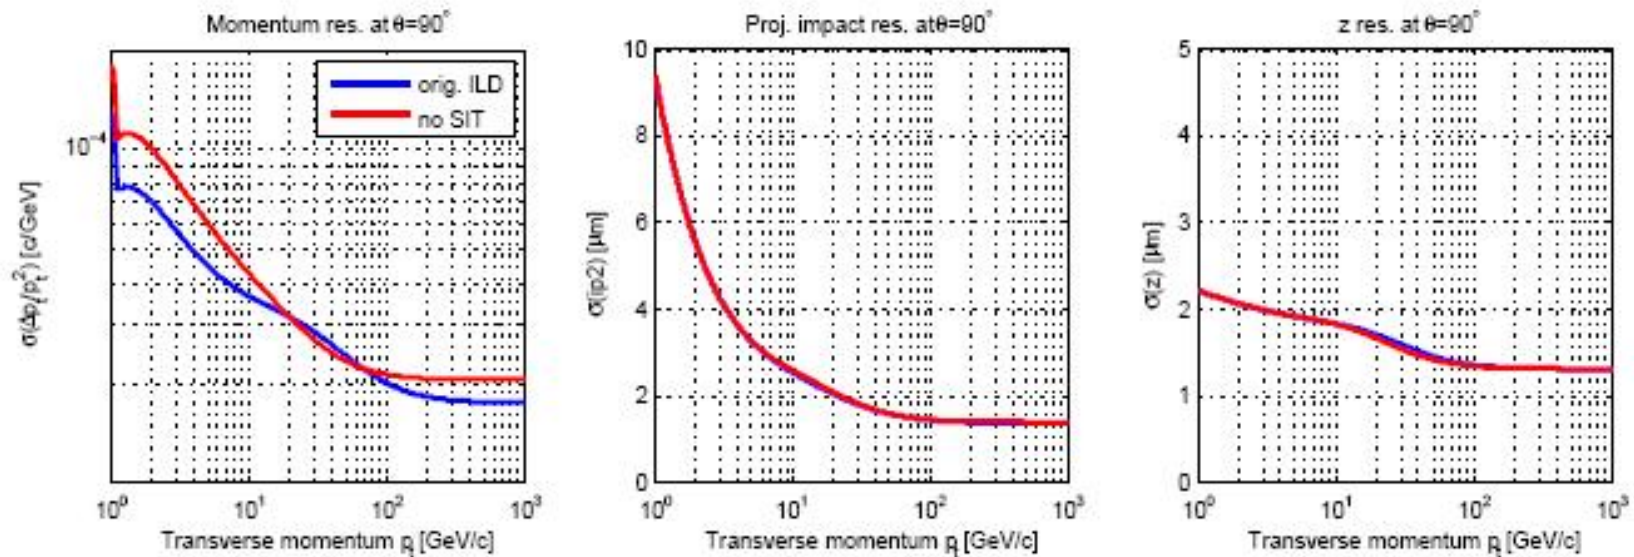

- No study of the inner detector support yet
- Important to understand the support of the beam pipe, stability, vibrations, etc.

Preliminary idea: the FTD small disks 7x2 and the 2 DS SIT layers will be included in a single envelope made of rohacel I foam included into 2 foils of C-fiber

Tracking performance as function of p_T , at $\vartheta = 90^\circ$

(Evaluation at the inner side of the beamtube)

Tracking performance as function of p_T , at $\vartheta = 90^\circ$

(Evaluation at the inner side of the beamtube)

The SET provides a precise z measurement at large lever arm!

Optimization of ILD's forward tracker

Up to now:

- 3 pixel disks *FTD1-FTD3* near the vertex detector
- 4 microstrip disks *FTD4-FTD7* with equal resolution in R and $R\phi$ (stereo angle $\alpha = 90^\circ$)

Optimized setup:

- Pixel disks untouched
- use sensors with stereo angle $\alpha = 6^\circ$ (like in CMS)
 - *FTD4, FTD5, FTD7*: one radial strip direction, the other one inclined by 6° (measures $R\phi$ very precisely)
 - *FTD6*: module rotated by 90° , measures R very precisely

Optimization of ILD's forward tracker

ILD:

$\alpha_{4,5,6,7} = 90^\circ$ (“+ + + +”)

Optimized setup:

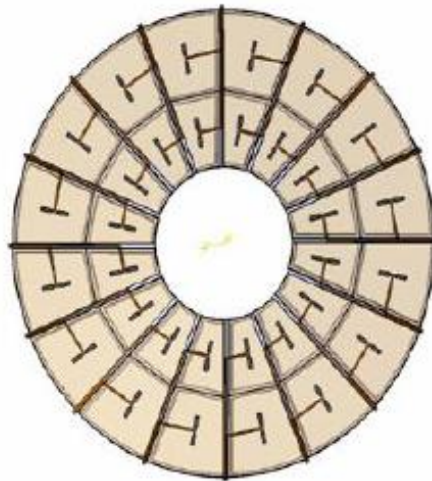

$\alpha_6 = 6^\circ$, rotated by 90° ,
 $\alpha_{4,5,7} = 6^\circ$ (“|| || = ||”)

FTD disks

4th FTD DESIGN

- Applying the design to all the petals of the FTD
- In the right picture we can see the rotation of the petal respect to the beam pipe axis
- In the bottom picture we can see the 4th FTD perpendicular projection to the beam pipe.

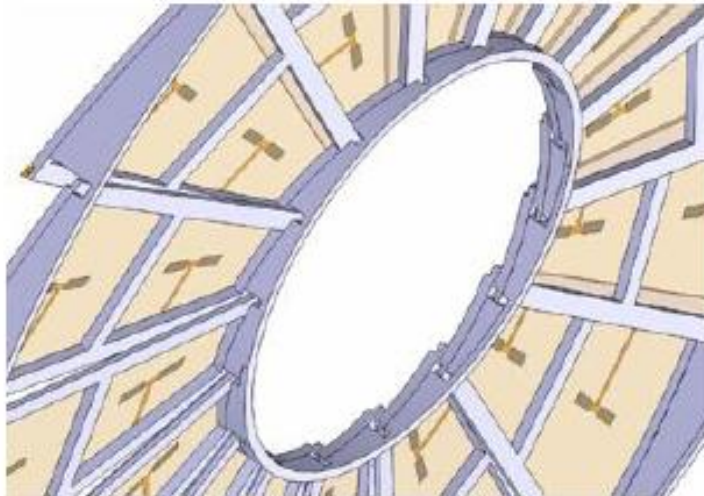

FTD 4 FASTEN DISK

IFCA

- Possible fasten of the petals using 2 disks

Inner fasten disk

out fasten disk

DISK 5,6,and 7 DESIGN

IFCA

- Once the FTD 4 geometry and design is defined, we apply this to the 5,6 and 7 forward tracking disk.

SMART MECHANICS FOR
SILICON TRACKERS

Alignment is going to be worked
out
by the IFCA team especially (more
soon)

Concluding remarks

- Works on integration of the Si components is undertaken by SiLC collaboration
- No show-stoppers
- But need to have collaborative effort with other subdetectors and MDI team to achieve a first reliable integration schema for all the components.
