DataProducer: Pixelman plugin which communicated with EUDAQ

- Receives commands from Run Control
- Sends data to Data Collector
- Sends messages to Log Collector

DataCollector:

- Receives raw data
- Performs event building
- **New: Plugin mechanism**
LCIO converter plugin for every raw data format

- Timepix measures clock cycles to end of shutter window
⇒ precise length, small jitter
- Software shutter is not precise (Windows timing: 1ms)
⇒ use precise hardware pulse generator

Software problem:

- Latest Pixelman version does not support hardware shutter any more
⇒ Bypass the Muros and give shutter signal directly to chip

Attention: Shutter and readout have to be synchronised. Opening the shutter while reading out the chip will disrupt the communication. Chip has to be reset.

- TLU inhibits triggers while device is busy.

- TLU signals trigger for each device
- DAQ device asserts busy, TLU takes down trigger
- TLU blocks all further triggers while any of the devices is busy

The TLU does not always block the trigger properly:

- Event numbers get out of sync
- Communication with Timepix chip is disrupted

Special “OR” realised using a programmable logic box (NEMBox):

- Channels are raised asynchronously
- Channels are lowered synchronously

⇒ Trigger system works perfectly!

Ar/CO₂ 70/30 (finished):

- Different drift distances
- Different angles
- Different particle energies
- Different GEM settings

T2K Gas (starts tomorrow):

- Different drift distances
- Different angles
- Different particle energies
- Different GEM settings
- Laser dots
