# Module with GEMs & Timepix

anode plane

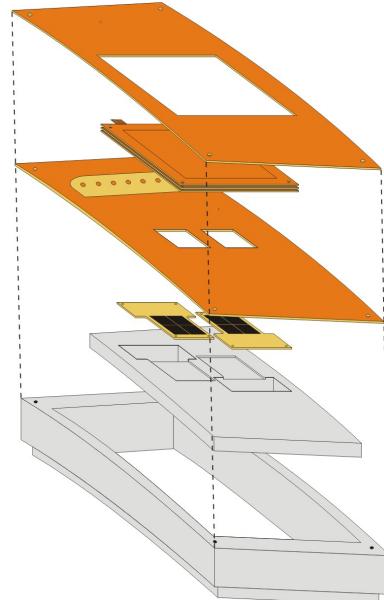

GEMs

readout plane

quad-boards

reinforcement of  
anode plane

redframe

## Gas amplification stage:

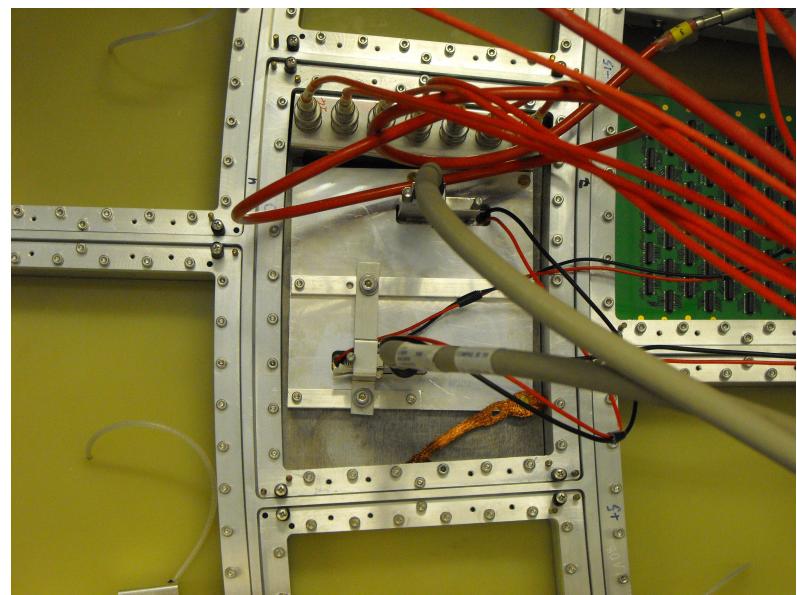

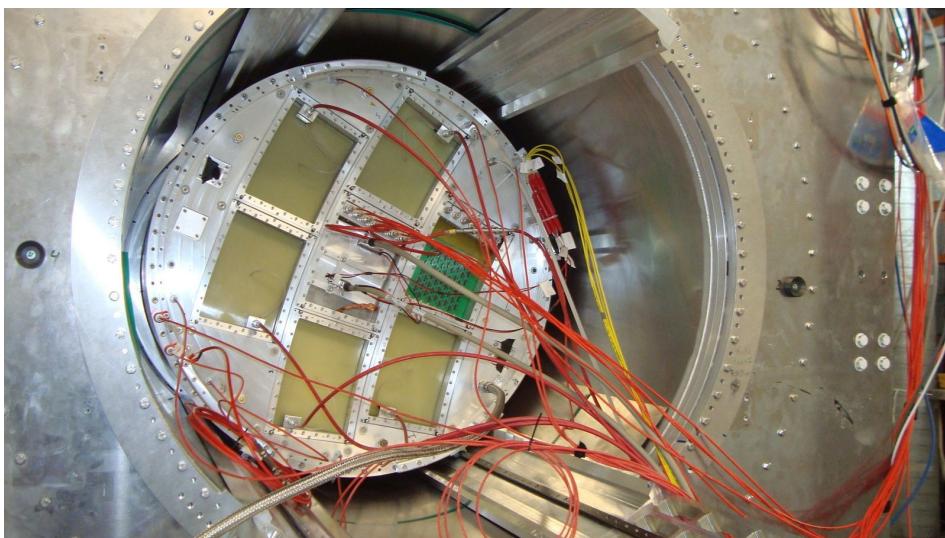

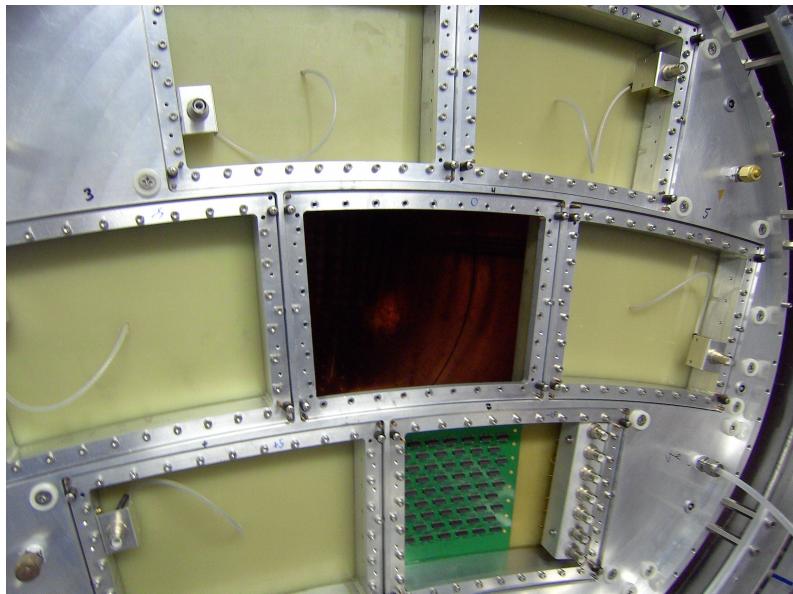

3 standard CERN GEMS (60/70/140)

1 mm spacing between GEMs

## Readout:

2 quadboards (4 Timepix chips each)

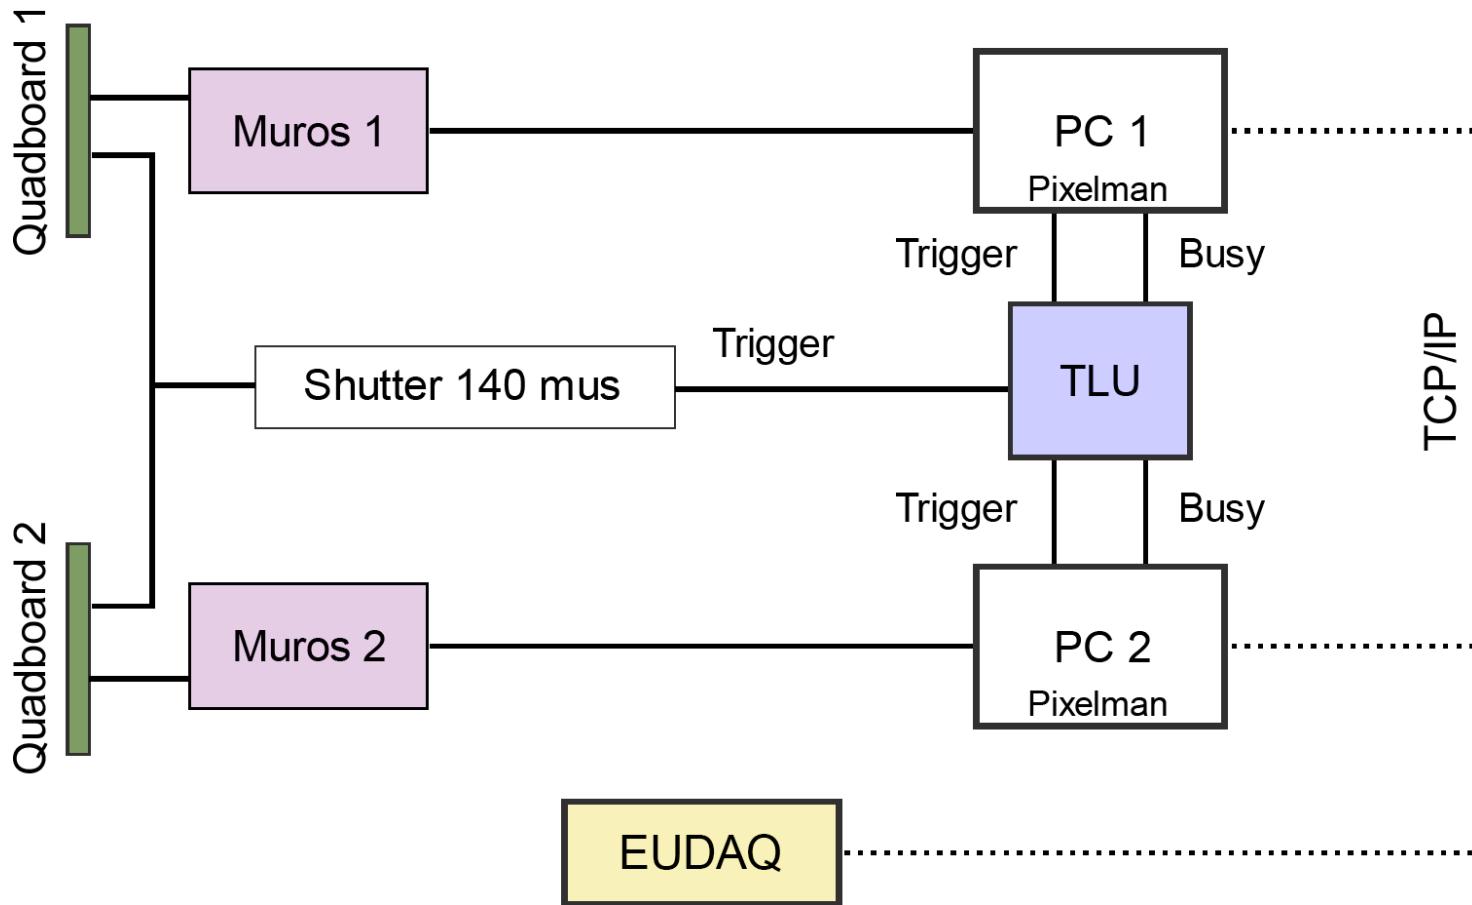

# Pictures from Installation

# Readout scheme

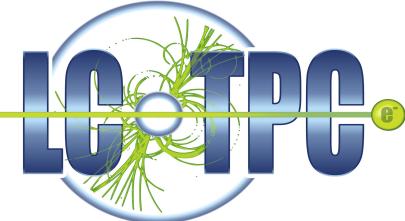

Using 2 Muros systems synchronized by TLU and EUDaq

Data is written directly in the LCIO format.

# EUDAQ: The Eudet Data Acquisition System

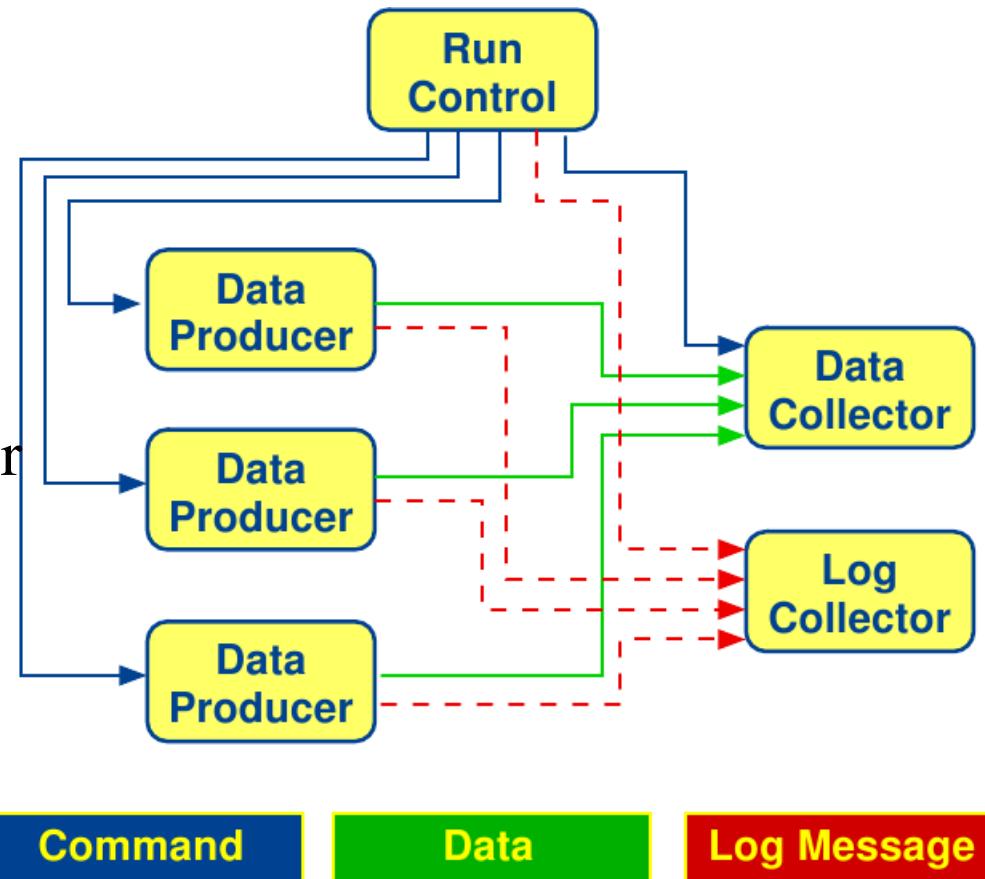

DataProducer: Pixelman plugin communicates with EUDAQ

- Receives commands from Run Control
- Sends data to Data Collector
- Sends messages to Log Collector

DataCollector:

- Receives raw data
- Performs event building
- New: Plugin mechanism
- LCIO converter plugin for every raw data format

# Hardware Shutter

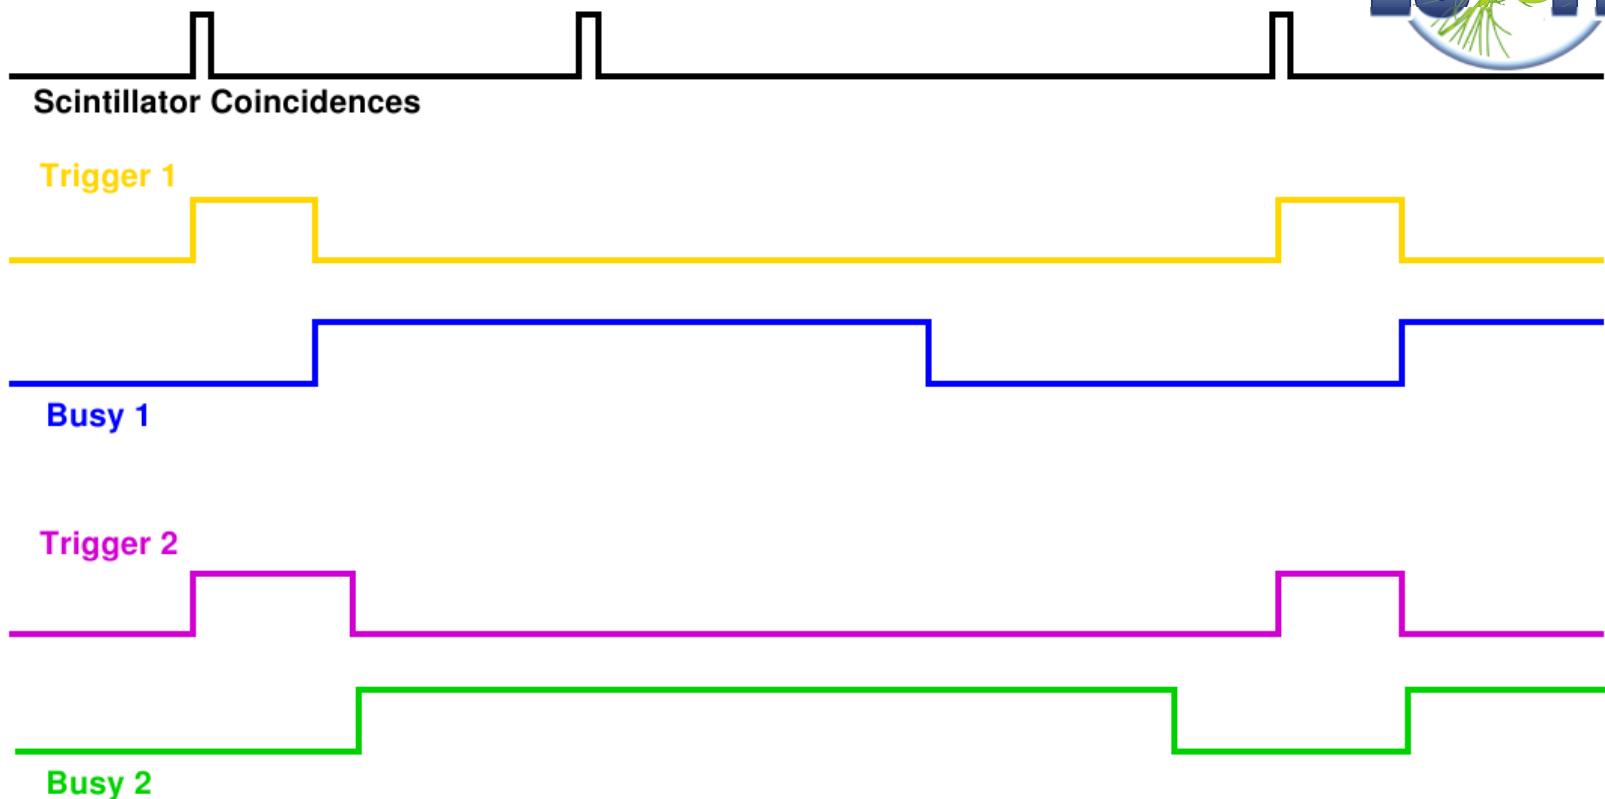

- Timepix measures clock cycles to end of shutter window  
    ⇒ precise length, small jitter
- Software shutter is not precise (Windows timing: 1ms)  
    ⇒ use precise hardware pulse generator
- Software problem:

Latest Pixelman version does not support hardware shutter any more  
⇒ Bypass the Muros and give shutter signal directly to chip

Attention: Shutter and readout have to be synchronized. Opening the shutter while reading out the chip will disrupt the communication. Chip has to be reset. TLU inhibits triggers while device is busy.

# The TLU Trigger-Busy-Handshake

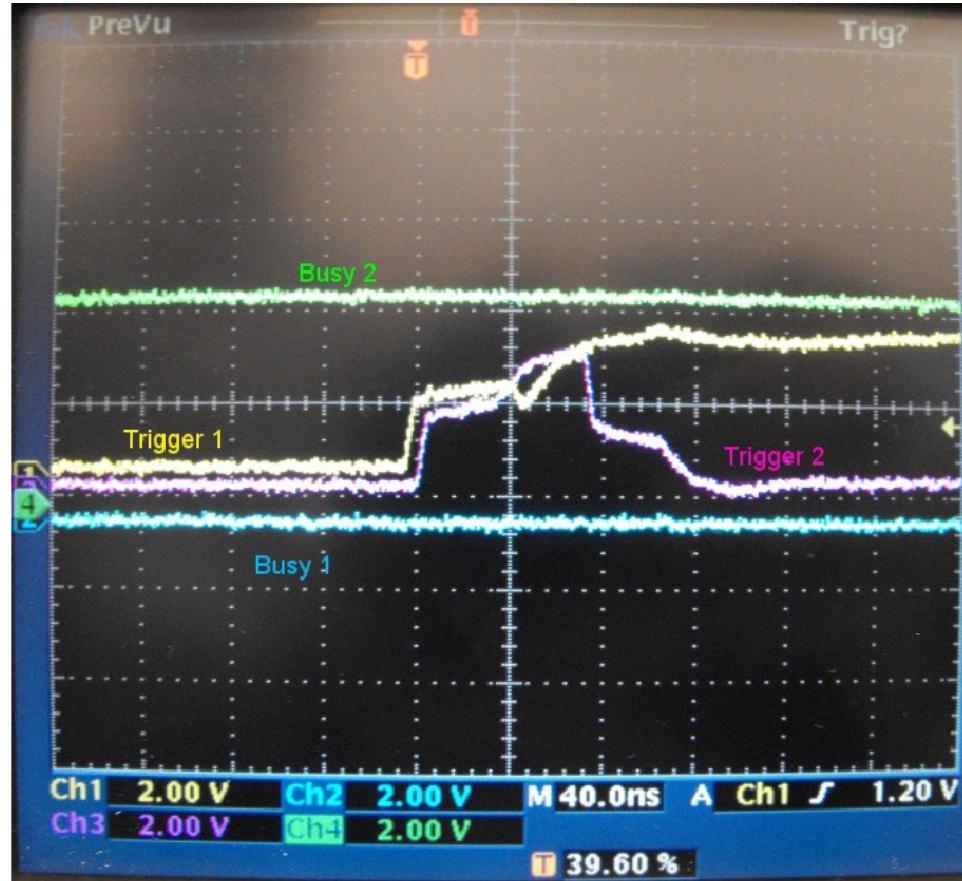

- TLU signalizes trigger for each device
- DAQ device asserts busy, TLU takes down trigger
- TLU blocks all further triggers while any of the devices is busy

universität bonn

# TLU problem

TLU does not always block the trigger correctly

- Event numbers get out of sync
- Communication with Timepix chip is disrupted

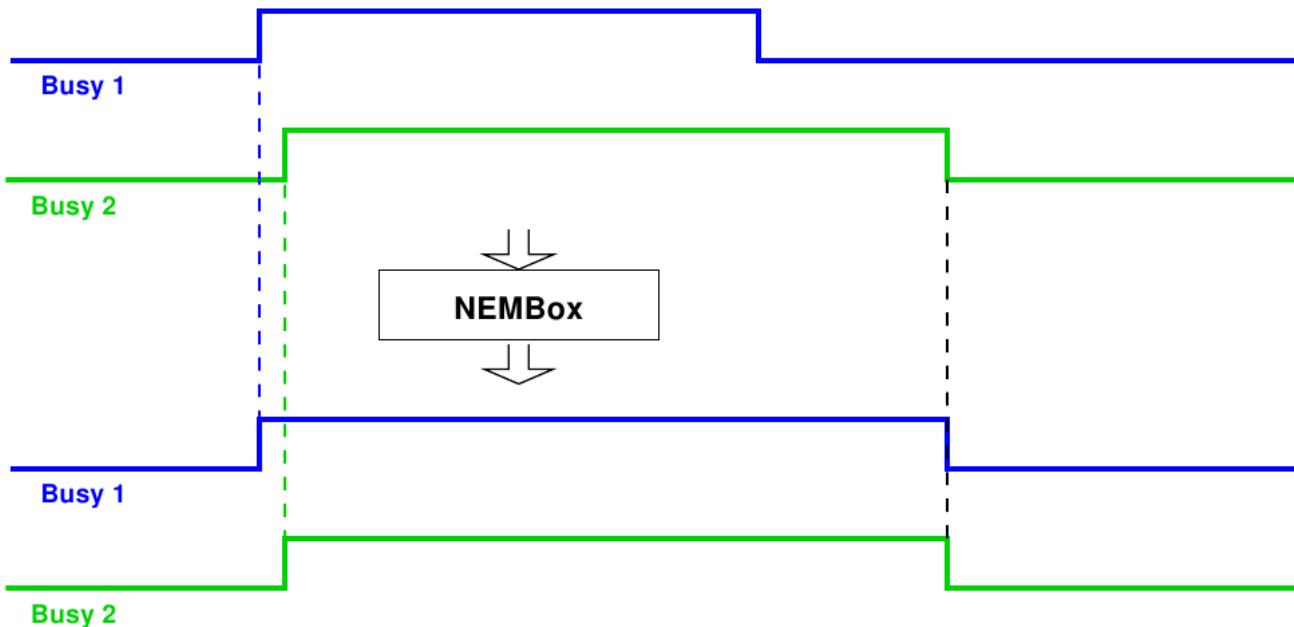

# Solution to the TLU problem

Special “OR” realized using a programmable logic box (NEMBox):

Channels are raised asynchronously

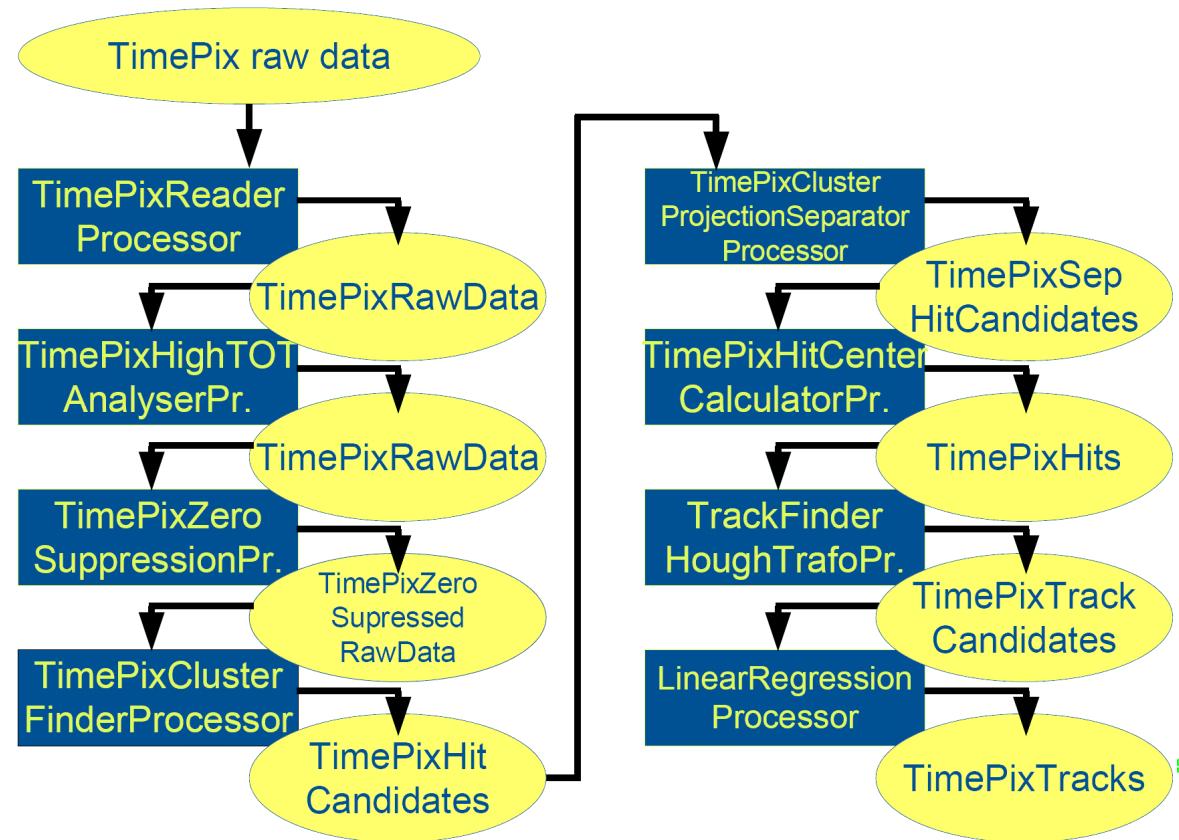

Channels are lowered synchronously

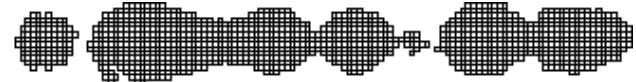

=> Trigger works fine

# MarlinTPC for Timepix data

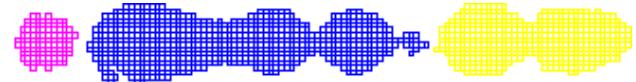

Reconstruction and analysis chain for Timepix data has been established and verified.

Example:  
Cluster separator

clusters defined by combining neighboring pixels

overlapping clusters are separated at local minima

Some processors have to be modified to deal with quadboards:  
e.g. Some mappings are not available

# Data Sets

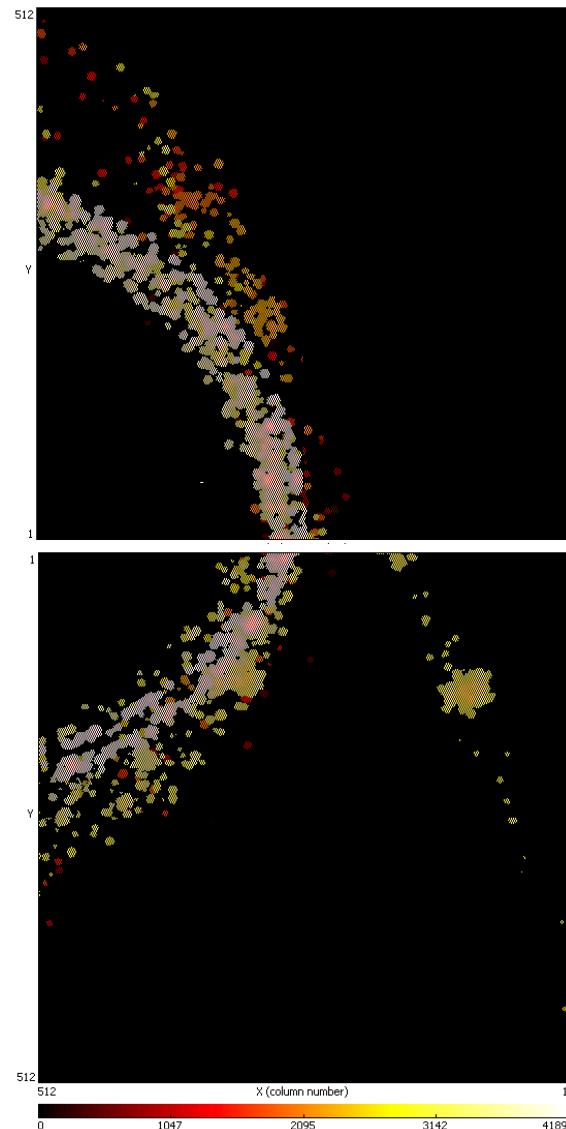

He:CO<sub>2</sub> 70:30:

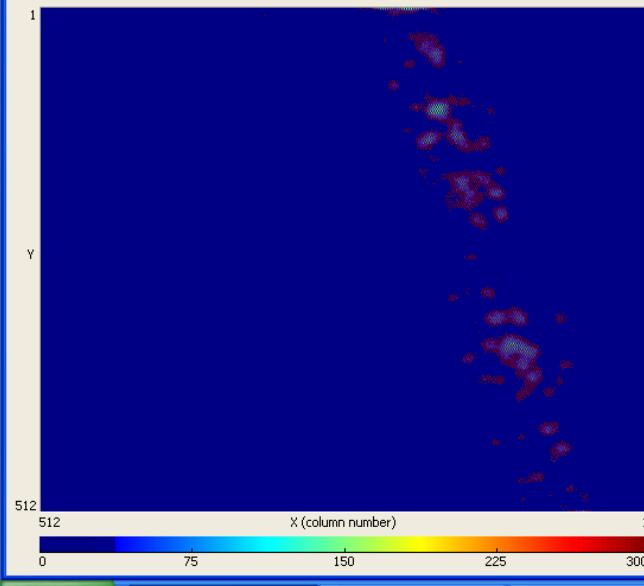

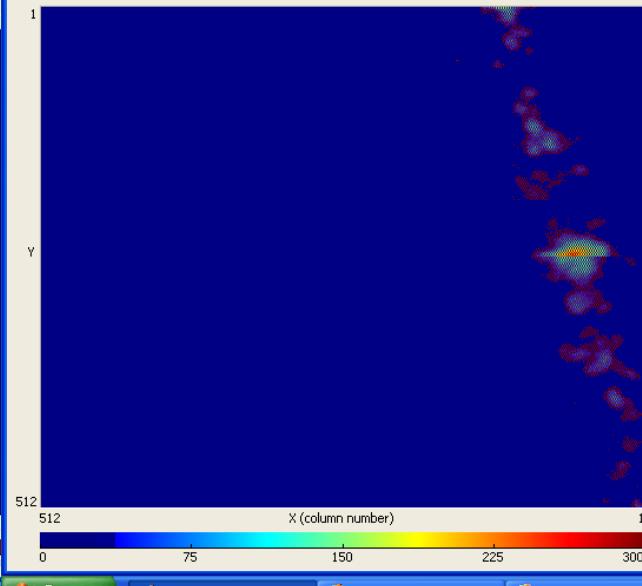

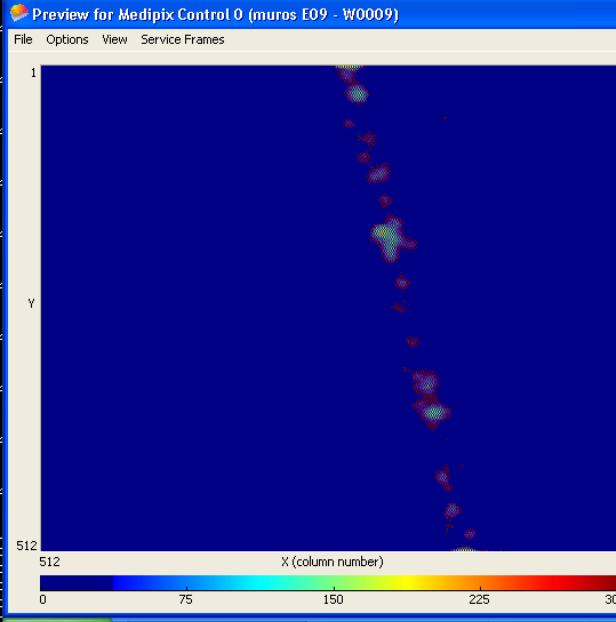

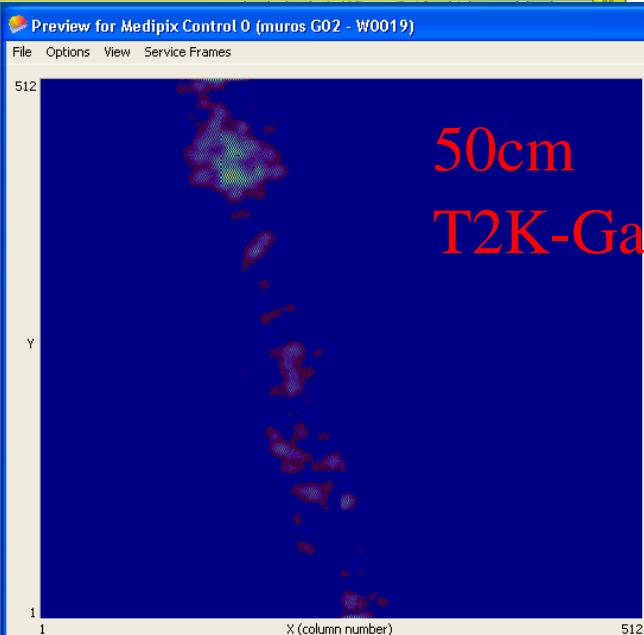

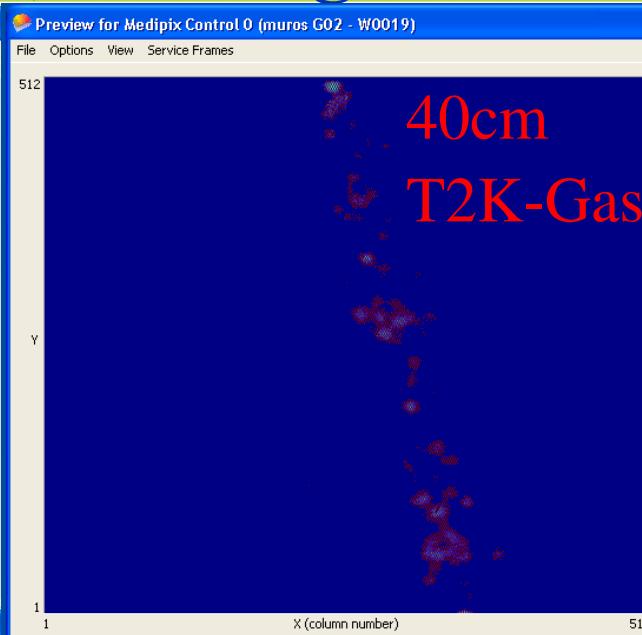

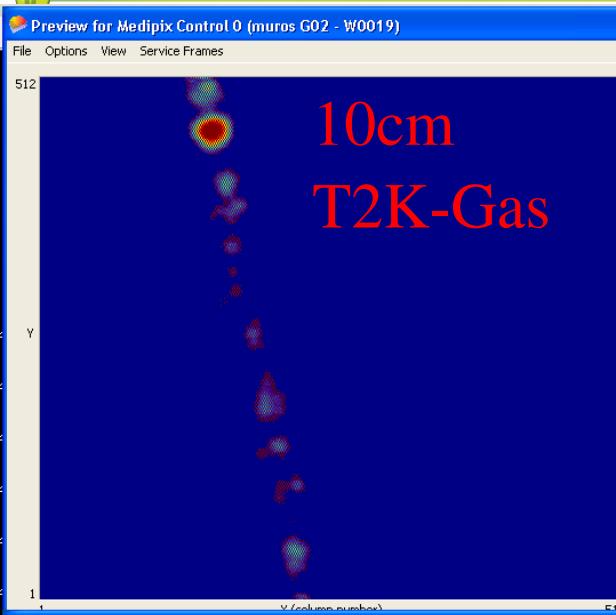

- Different drift distances
- Different angles
- Different particle energies
- Different GEM settings

T2K Gas:

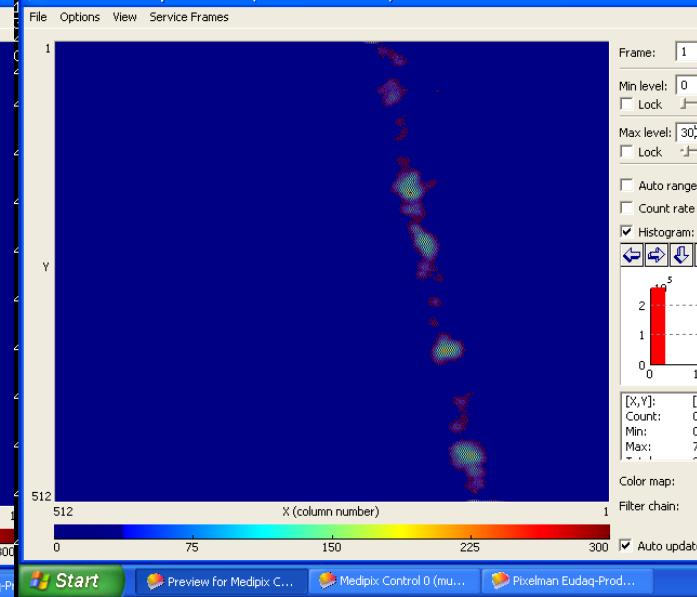

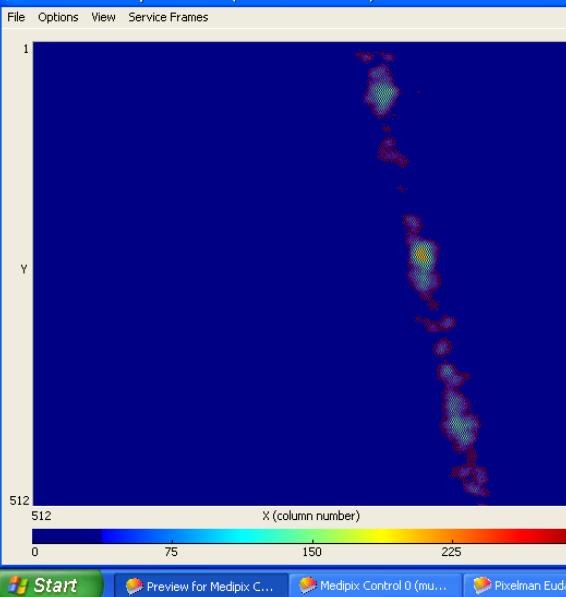

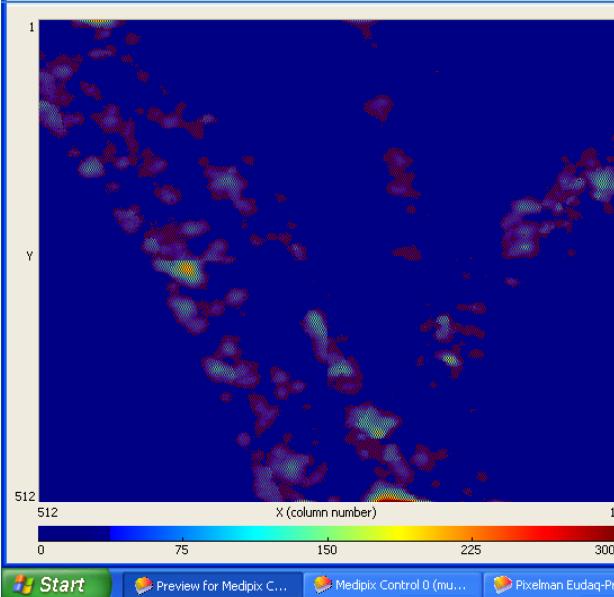

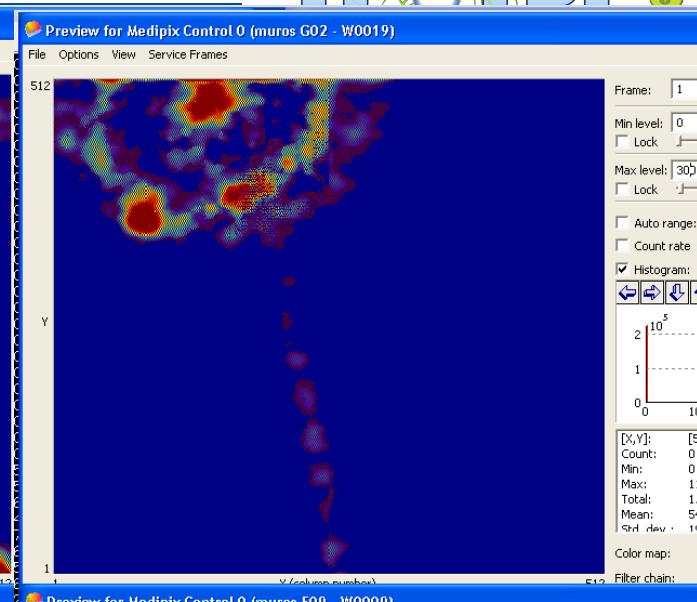

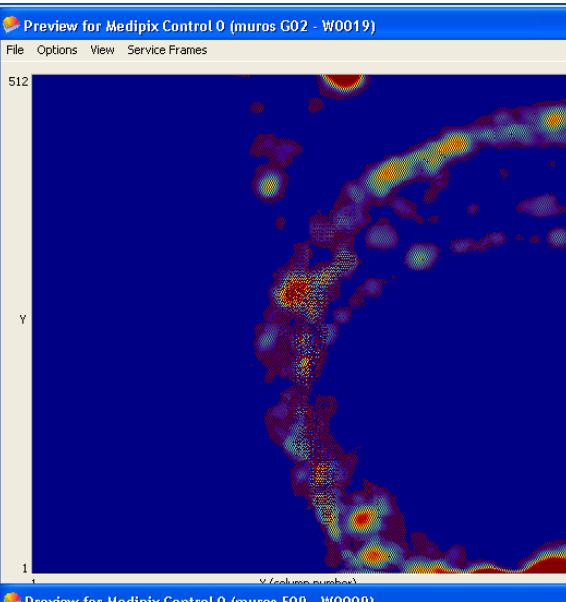

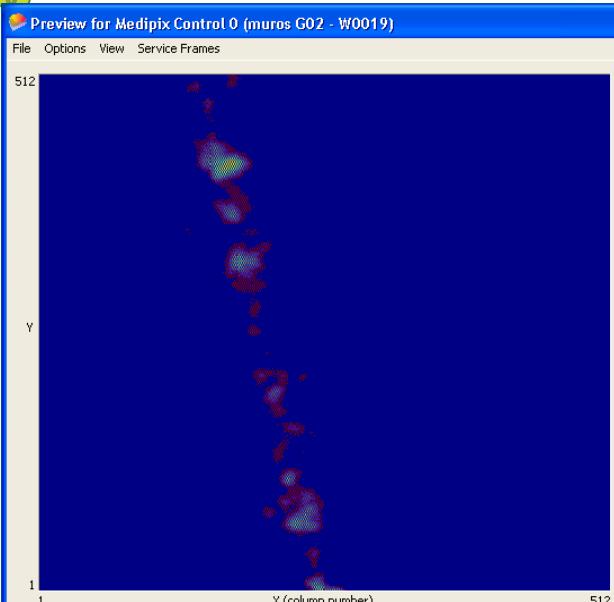

- Different drift distances
- Different angles
- Different particle energies
- Different GEM settings
- Laser dots

# Thank you!

We would like to thank everyone who helped us before and during the test beam.

The FLC group, especially

Klaus Dehmelt, Christoph Rosemann, Takeshi Matsuda, Ralf Diener,  
Bakul Gaur, Oliver Schäfer

The DESY accelerator people, who provided a stable beam.

The Bonn technicians Walter Ockenfels and Hubert Blank for building  
the detectors.
