

MIT HCAL variants ZZ mass/energy plots

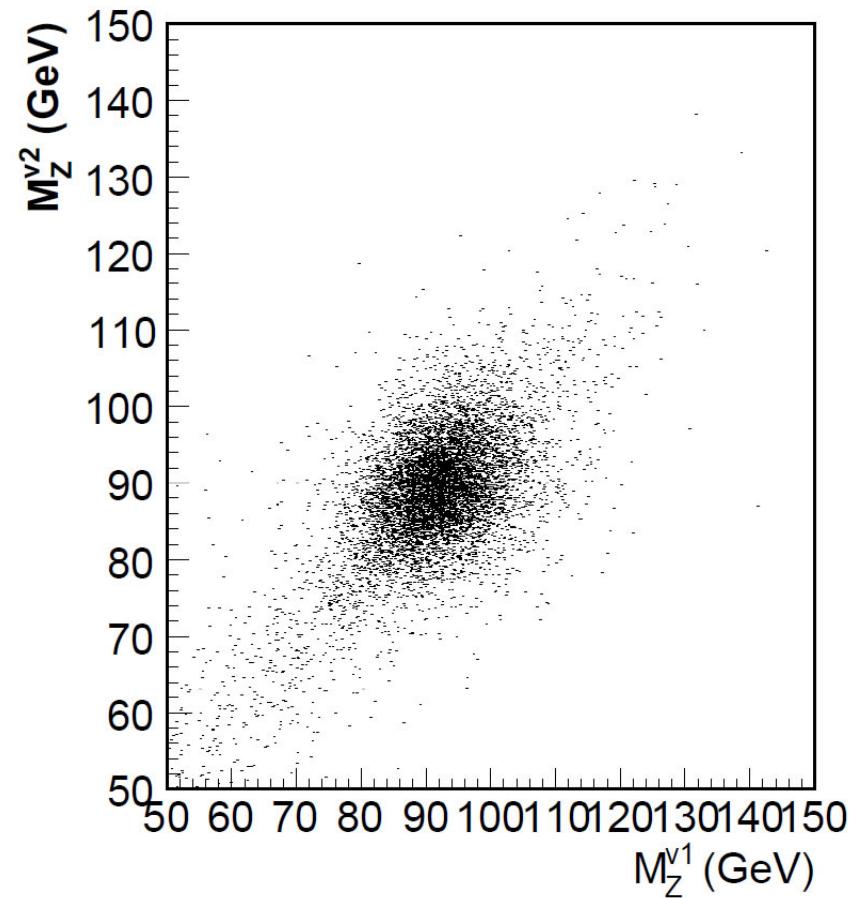

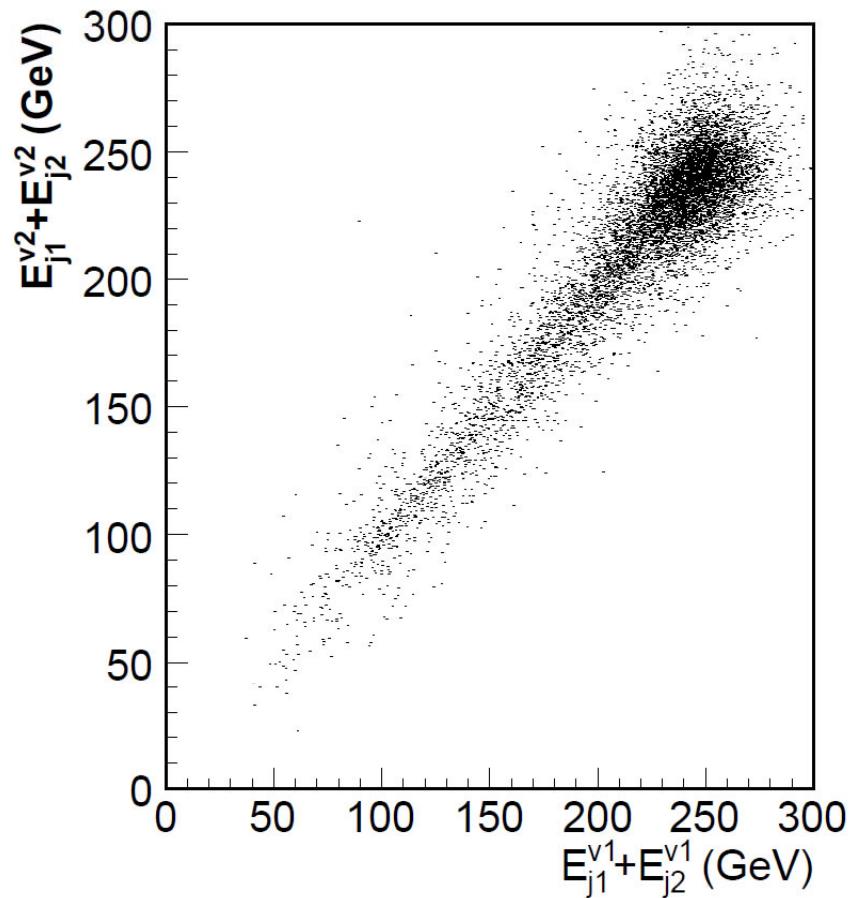

Raphael Cervantes, Ray Cowan, Peter Fisher

April 8, 2010

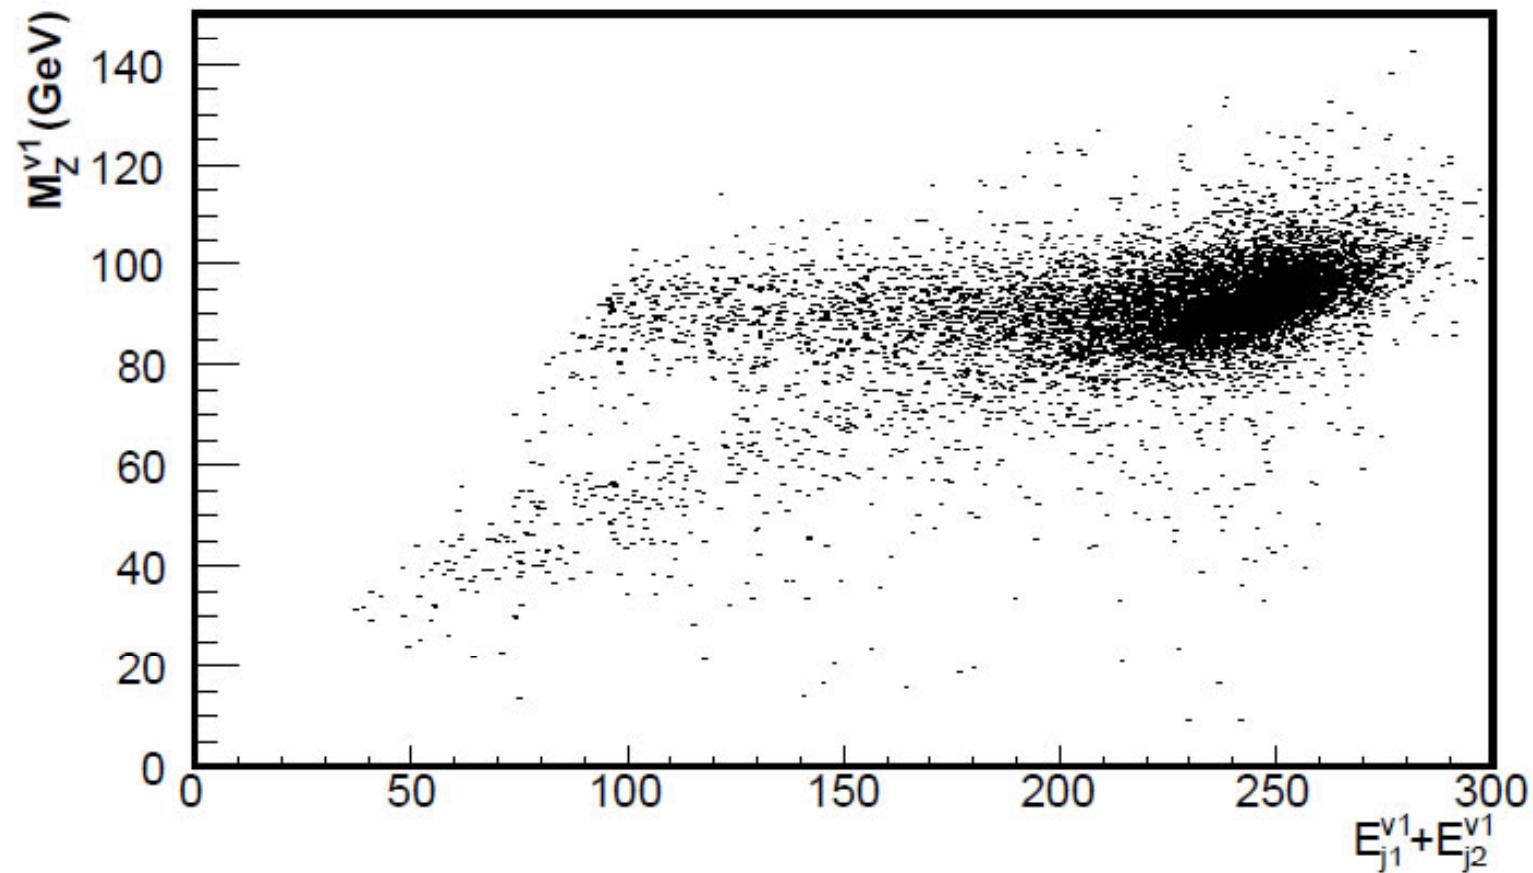

Definitions for following plots

- Following plots compare these two HCAL variants
 - Variant 1 (v1): 4.0λ , 30 layers, cell size $1 \times 1 \text{ cm}^2$
 - Variant 2 (v2): 6.0λ , 60 layers, cell size $1 \times 1 \text{ cm}^2$
- Data is ZZ @ 500 GeV, Z → nunubar, Z → uds
 - With gluon radiation and beamstrahlung

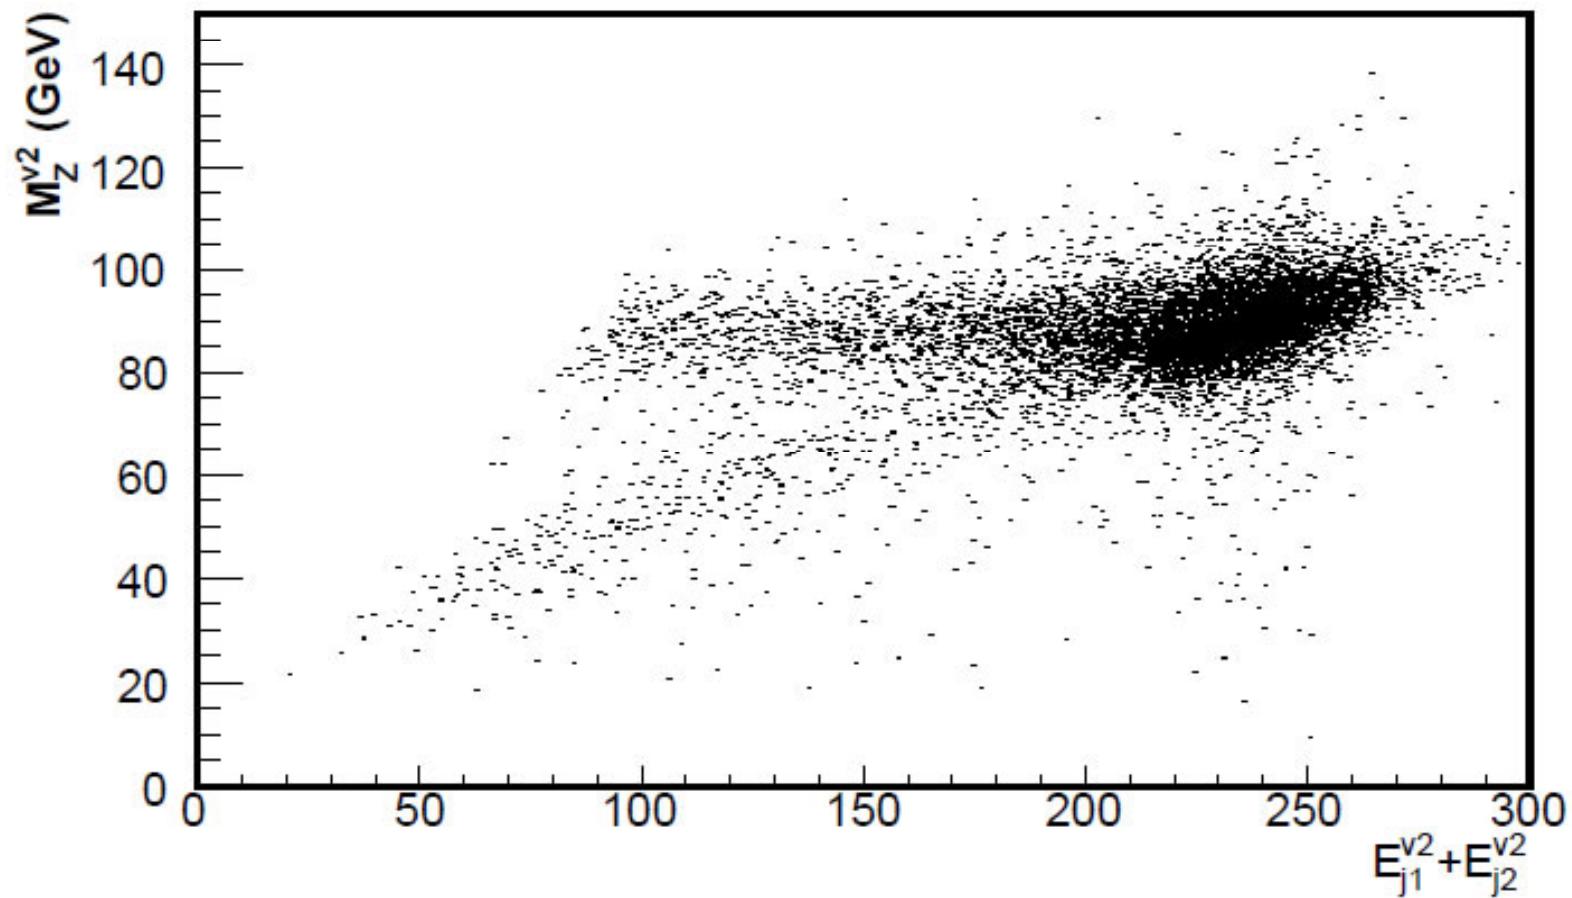

V1 vs. V2 recon energy sums, mass

V1 recon Z mass vs. recon E sum

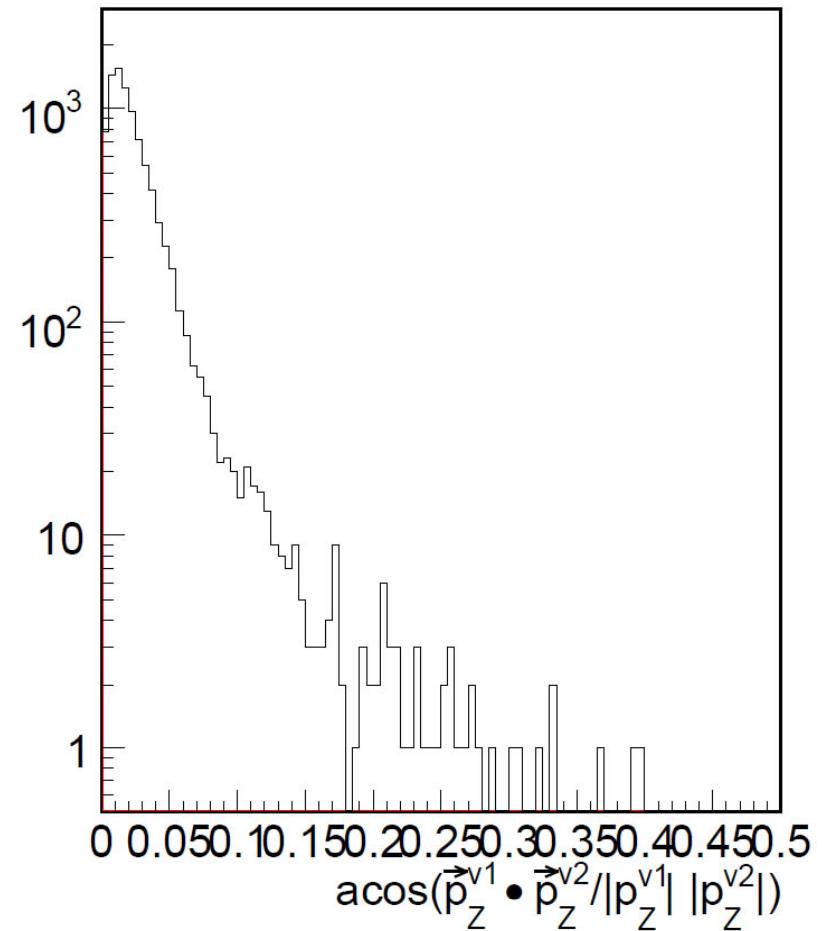

V2 recon Z mass vs. recon E sum

V1 vs V2 recon dijet angle (acos)

Note: horizontal axis runs from 0.0 to 0.50 radians

Other activities

- We have obtained permission to use the CMS Tier 2 facility at MIT
- Will run the $\lambda = 4.5$ and $\lambda = 5.5$ variants
- Should be done much faster than on our small Condor batch system
