# DRImageDB: What is it?

- Knowledge database that allows to store plots and associated information in a data base and display it via a JSP based web application (running on Tomcat or glassfish)
- Ultimately will consist of the following components:
  - Postgres DataBase
  - Web Application to select and display content and for Experts to modify the data base (upload, delete, update)  
<http://kyoto.fnal.gov:8080/DRImageDB/>
  - Java application for multiple file uploads to data base uses xml description as input
  - Java library (jar file) contains all classes to access the objects and store them in the data base (used by Java application and webapplication)
- All code is in the CERN SVN repository
- Database will ultimately hosted a DESY Zeuthen
- Prototype application for Geant 4 hadronic validation  
<http://g4jsp.ifh.de:8080/G4HadronicValidation/>

Name	Value
Particle	proton
Energy	1.0
Material	G4_BGO
Physics List	QGSP_BERT
Description	Process, all energies

Process, all energies, G4zBGO proton 1.0 GeV QGSPzBERT

Particle Interaction	Relative Frequency (approx.)
proton inel	10 <sup>4.2</sup>
neutron inel	10 <sup>4.3</sup>
neutron capture	10 <sup>4.1</sup>
gamma inel	10 <sup>2.5</sup>
pi+ inel	10 <sup>3.5</sup>
K+ inel	10 <sup>3.2</sup>
K* inel	10 <sup>3.1</sup>
pi- inel	10 <sup>2.8</sup>
K*0 inel	10 <sup>2.7</sup>
A inel	10 <sup>2.5</sup>
antiLambda inel	10 <sup>2.4</sup>
anti-neutron inel	10 <sup>2.3</sup>
anti-proton inel	10 <sup>2.2</sup>
Sigma+ inel	10 <sup>2.1</sup>
Sigma- inel	10 <sup>2.0</sup>
antiSigma+ inel	10 <sup>1.9</sup>
antiSigma- inel	10 <sup>1.8</sup>
mu capture	10 <sup>1.7</sup>
alpha inel	10 <sup>1.6</sup>
D inel	10 <sup>1.5</sup>

# Access to the data base

The Data Access Object (or DAO) pattern:

- separates a data resource's client interface from its data access mechanisms
- adapts a specific data resource's access API to a generic client interface

The DAO pattern allows data access mechanisms to change independently of the code that uses the data or the database that is used. ( currently we use postgresql). Allows to access the data in the way that's most convenient not as dictated by the database structure. Developer doesn't need to know SQL.

# Access to the data base

- All the database interactions are contained in service adapter (library);
- all the sql statements necessary to enter/delete one image (test) are combined into one transaction;
- use save-points so if something goes wrong the data base is rolled back.
- use prepared statements throughout;
- it has a delete,store, retrieve, update method that deletes all objects associated with an image from the database;

# Plans

- Complete separating access library (API) from web application and File Upload Application.
- Modify Web application to use access library
- Improve web application:
  - Better Navigation
  - Search function
  - Indexing (needs some feed back)
- Packaging for distributing and deploying (jar file for the java application, war file for web application).
- Apply to Geant4 hadronic validation package.
