

# Status of Strip Clustering

K. Kotera, Shinshu university

Physics and Software meeting of ILD Asia

21st January 2011

# with Latest Mokka, PandoraPFANew, and Daniel's Splitting module for hybrid ECAL

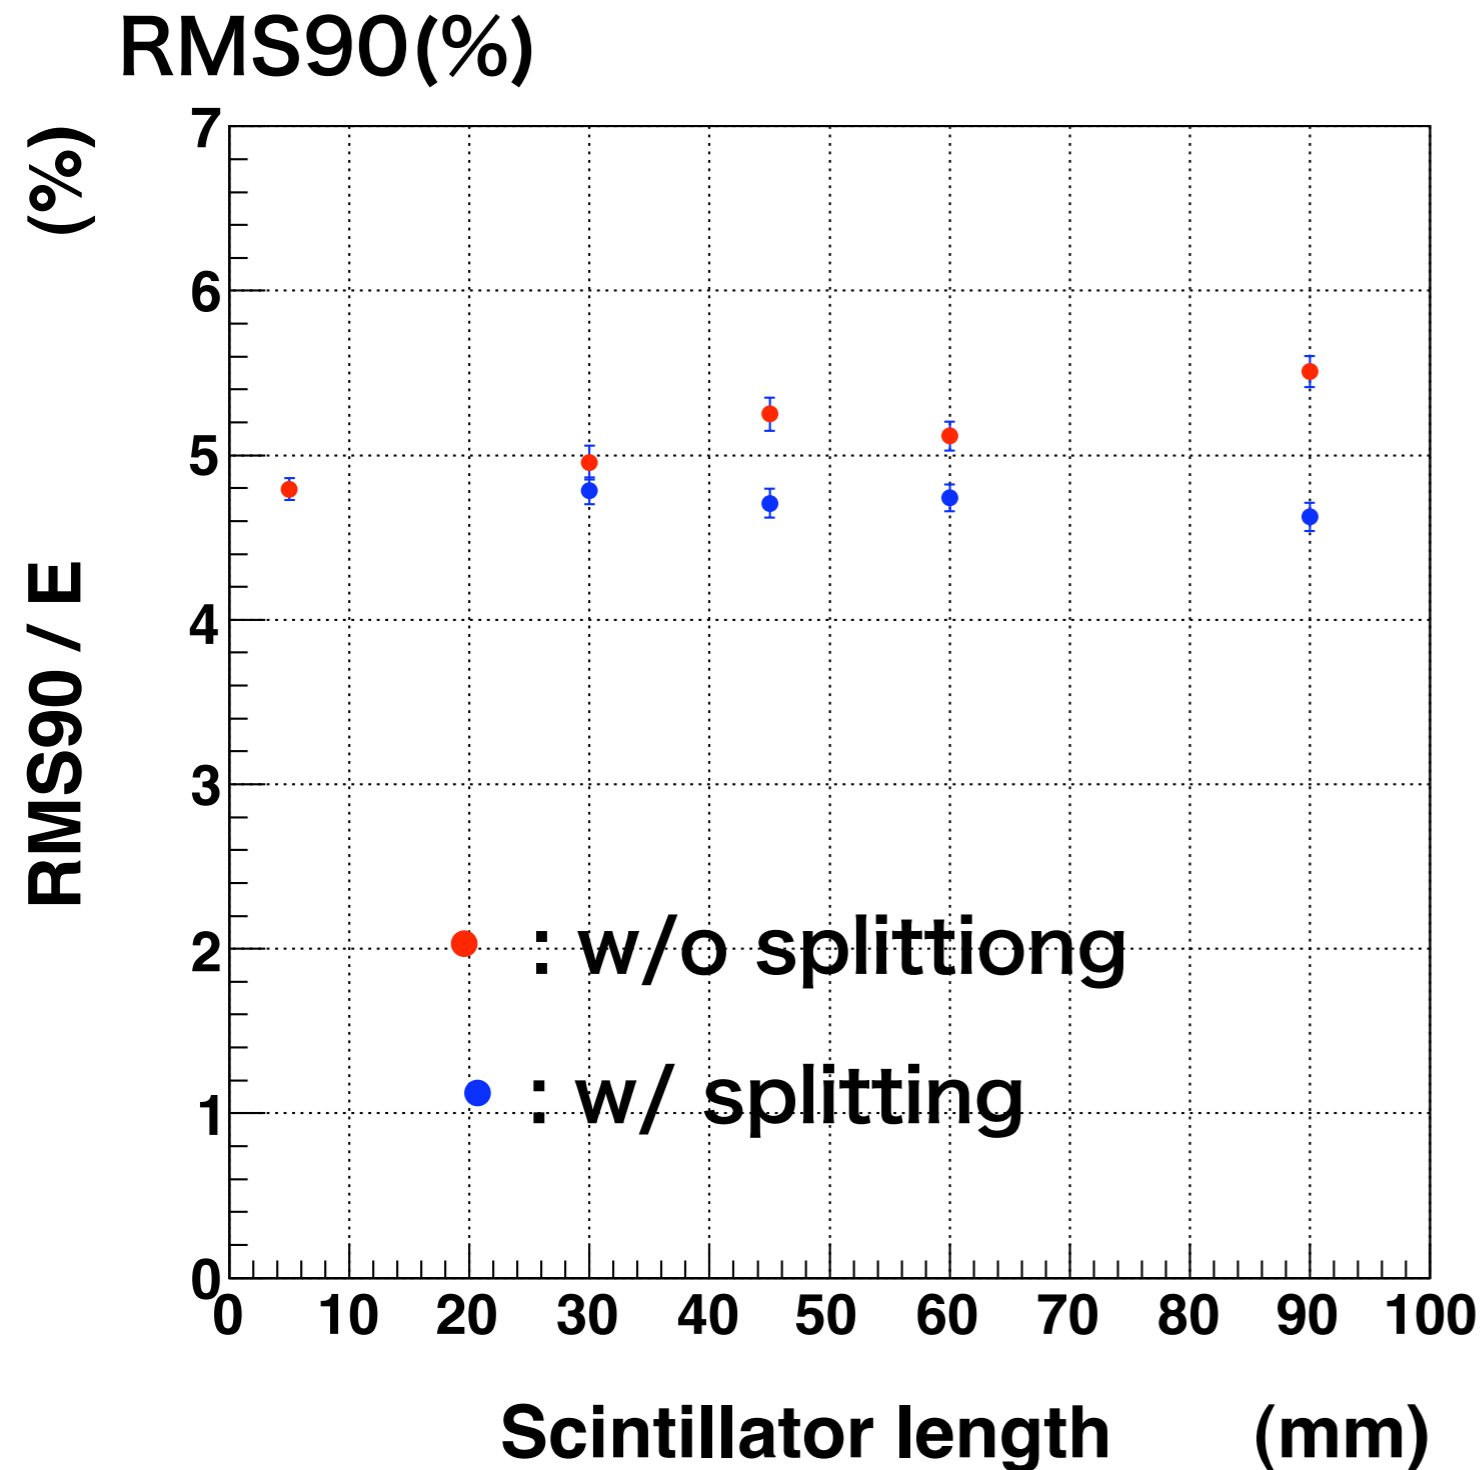

To get the following steps;

- to get better JER ( at least Mark's result )
- more realistic simulation (implement some dead volume from MPPC, reflector, cable, ...)
- to study hybrid ecal
- confirmation of our last result (IWLC)

I am trying to use:

- Latest Mokka, mokka-07-05
  - implemented scintillator strips
  - realistic geometry ( MPPC, Fiber, board,..)
- PandoraPFANew
  - easier tuning of parameters
- D. Jeans' Splitter module
  - for Si-Sc hybrid Ecal
  - Lighter than my version

# Results for $\sqrt{s} = 91$ GeV two-jet events shown at IWLC Nov.2010

-good performance of strip-splitting method was presented in Nov. 2010.

-For center energy 91, 200, 360, and 500 GeV JER of Sc strip ECAL with Strip-splitting method has the similar JER by 5x5 mm<sup>2</sup> square cell ECAL.

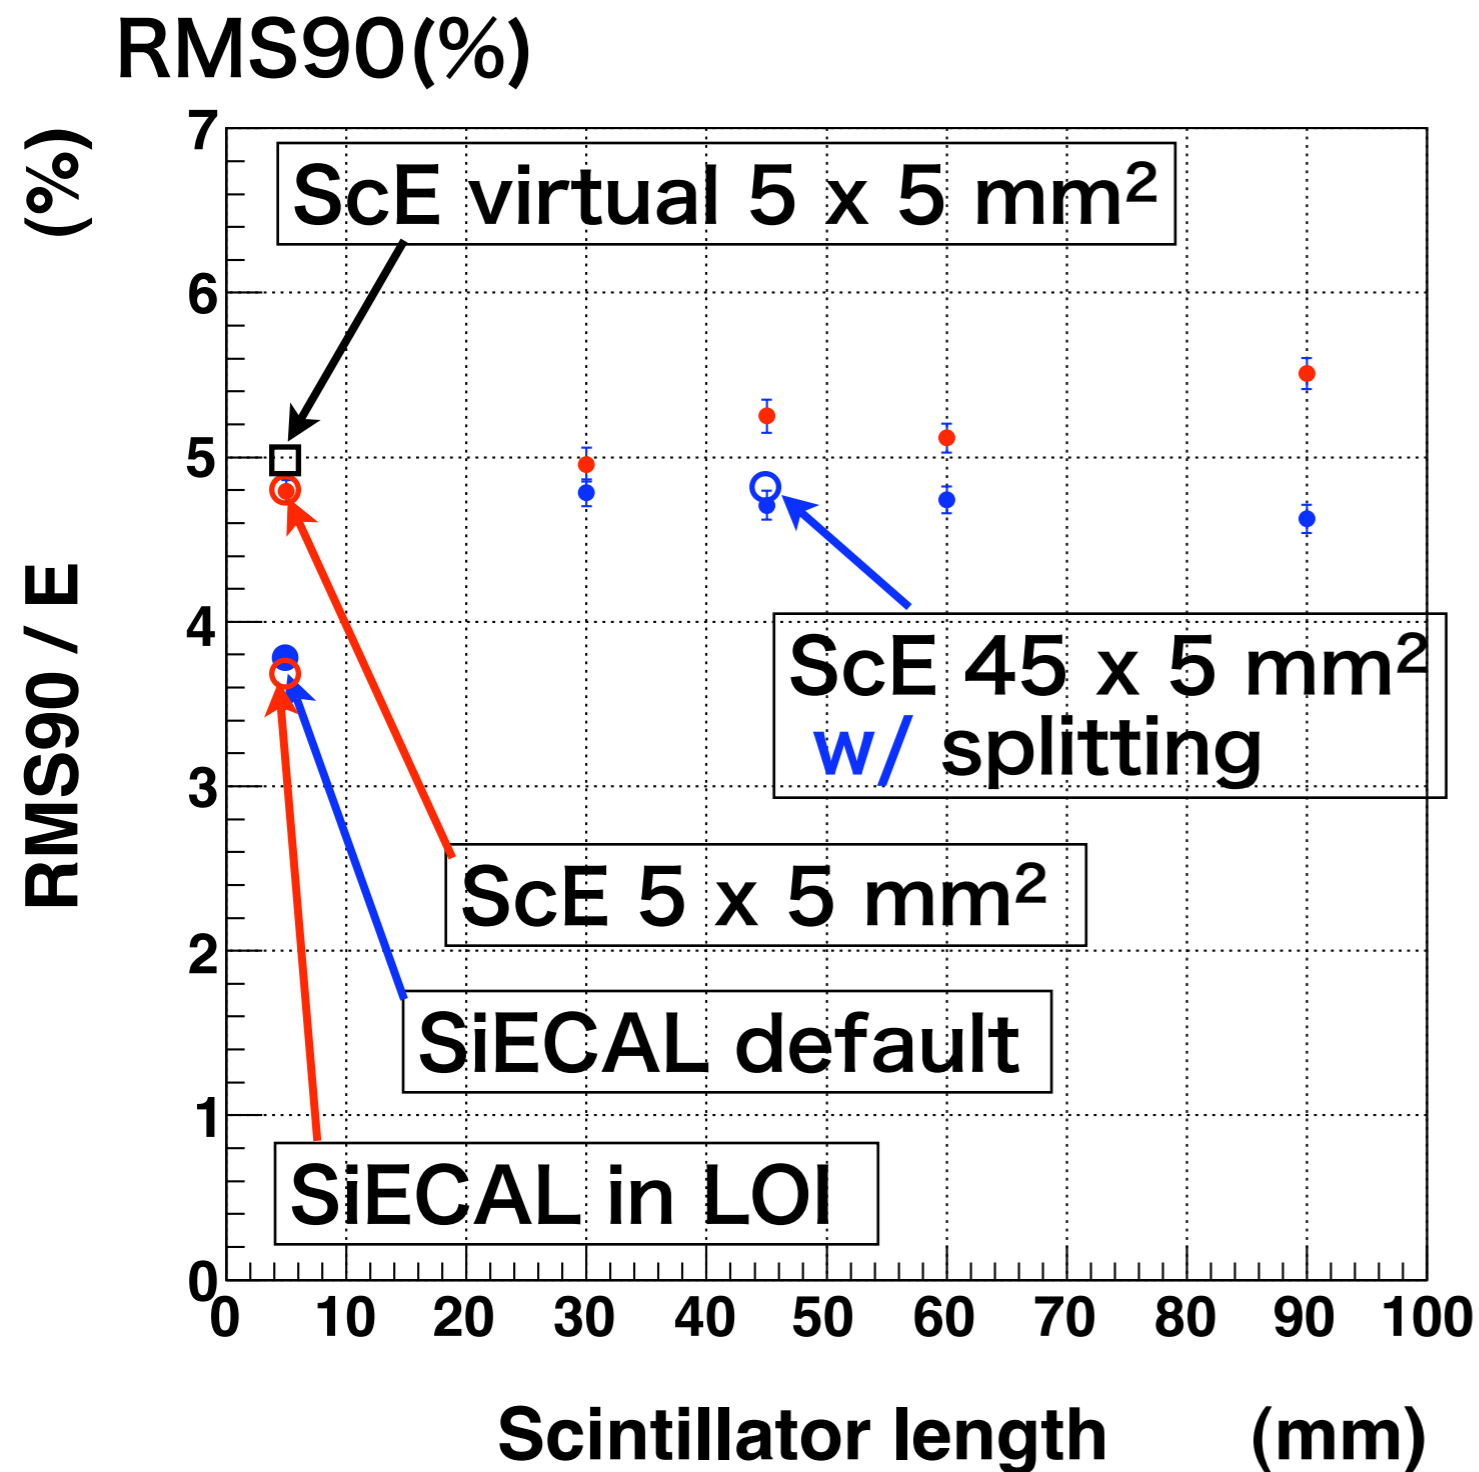

# Combination of PandoraNew, Mokka latest and Daniel's strip-splitting

JER with ScE 5x5 mm<sup>2</sup>, ScE virtual 5x5 mm<sup>2</sup> and ScE 45x5 mm<sup>2</sup> w/ splitting method have almost common JER

Strip-splitting performance shown in IWLC was confirmed with New Mokka simulation, in which strip shape is intrinsically implemented.

# Combination of PandoraNew, Mokka latest and Daniels strip-splitting

JER with ScE 5x5 mm<sup>2</sup>, ScE virtual 5x5 mm<sup>2</sup> and ScE 45x5 mm<sup>2</sup> w/ splitting method have almost common JER

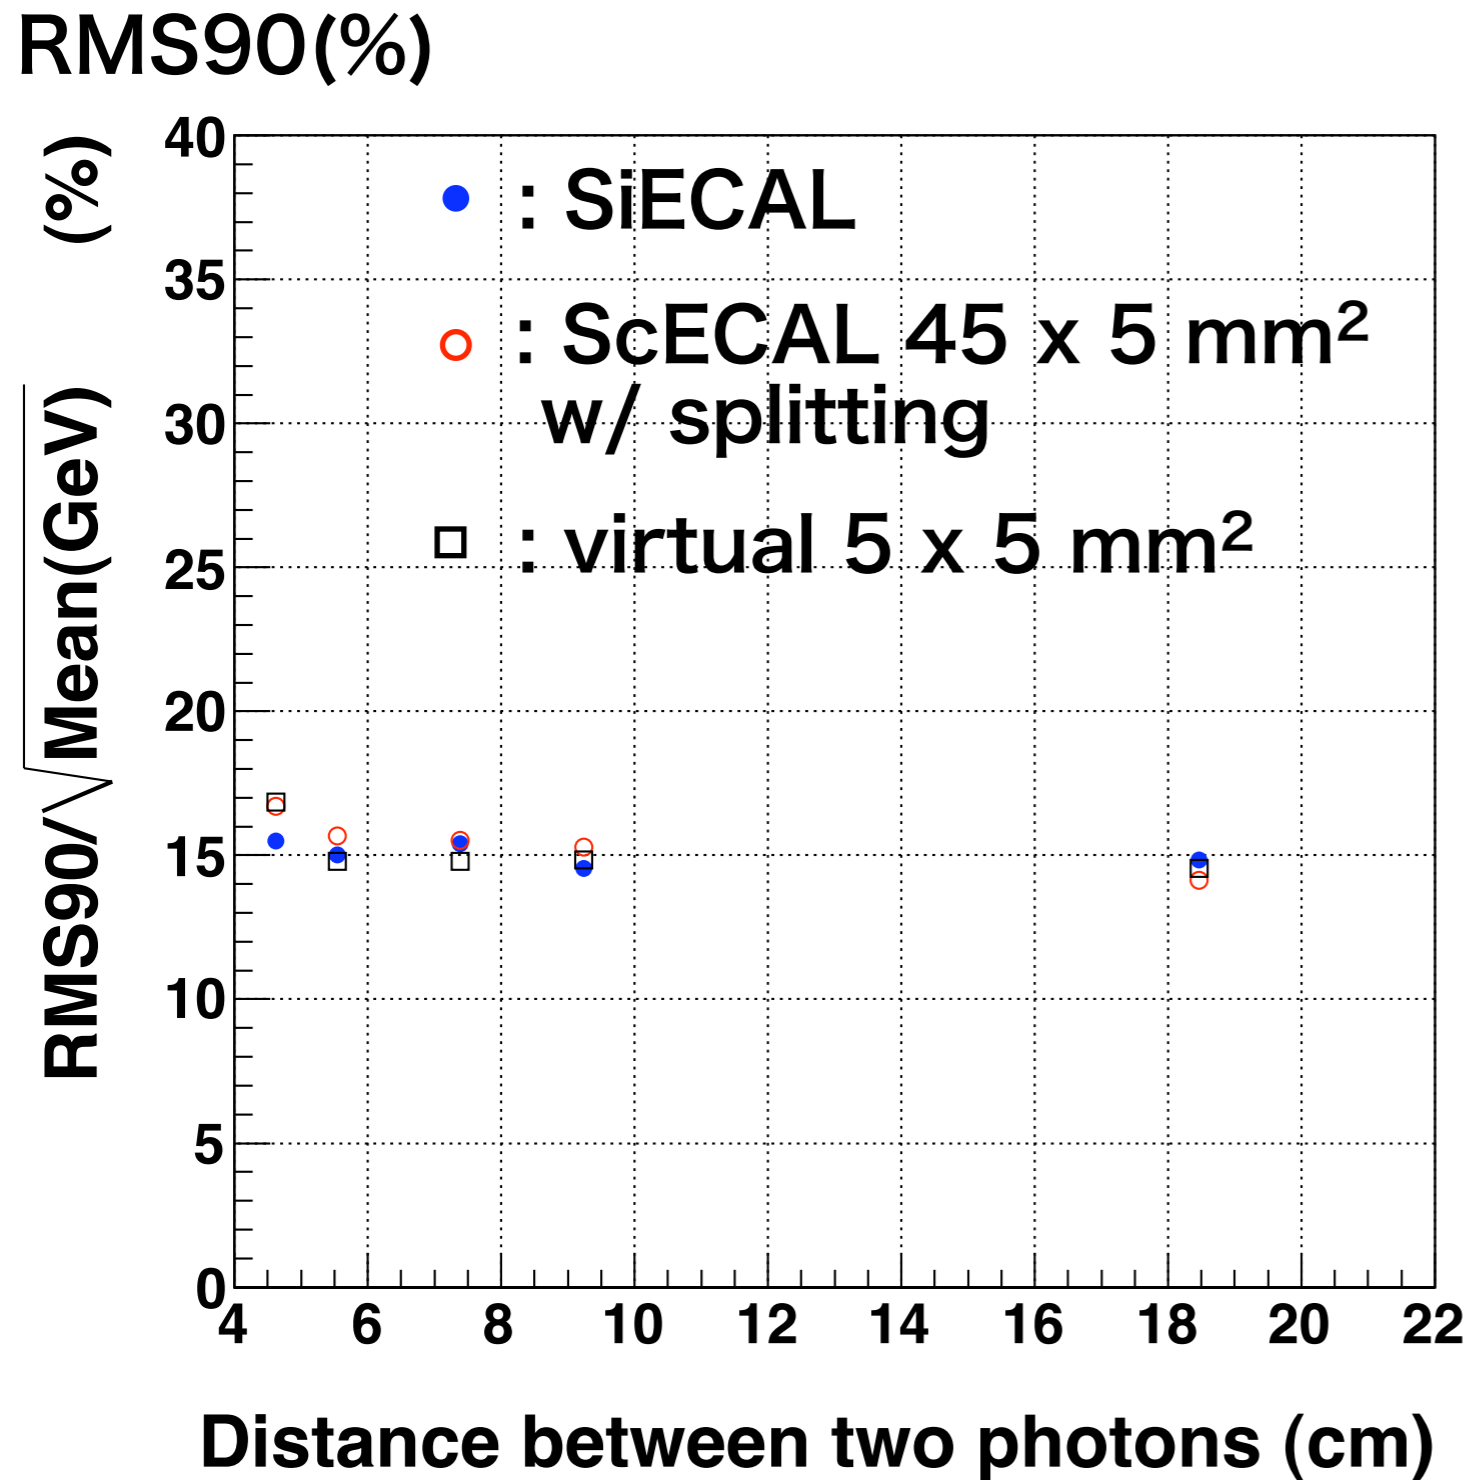

Strip-splitting performance shown in IWLC was confirmed with New Mokka simulation, in which strip shapes are intrinsically implemented.

SiECAL has better performance → we need tune for ScECAL

# Two photon clusters in SiEcal and ScStirpEcal with Splitting method

# Energy resolution of 10 GeV two photon events

-There is no large differences between SiECAL and ScECAL 45 x 5 mm w/ splitting method, although Energy resolution of ScECAL is slightly degrades as distance of photons decreases.

# Efficiency of two-cluster events for two-photon events

-Most clearly different point between Si and ScEcal is efficiency of two-cluster events.

-When distance of two photons is larger than 6 cm, two-cluster event efficiency by ScECAL is better than SiECAL. However, when the distance becomes smaller than 7 cm, the two-cluster event efficiency of ScECAL steeply drops down.

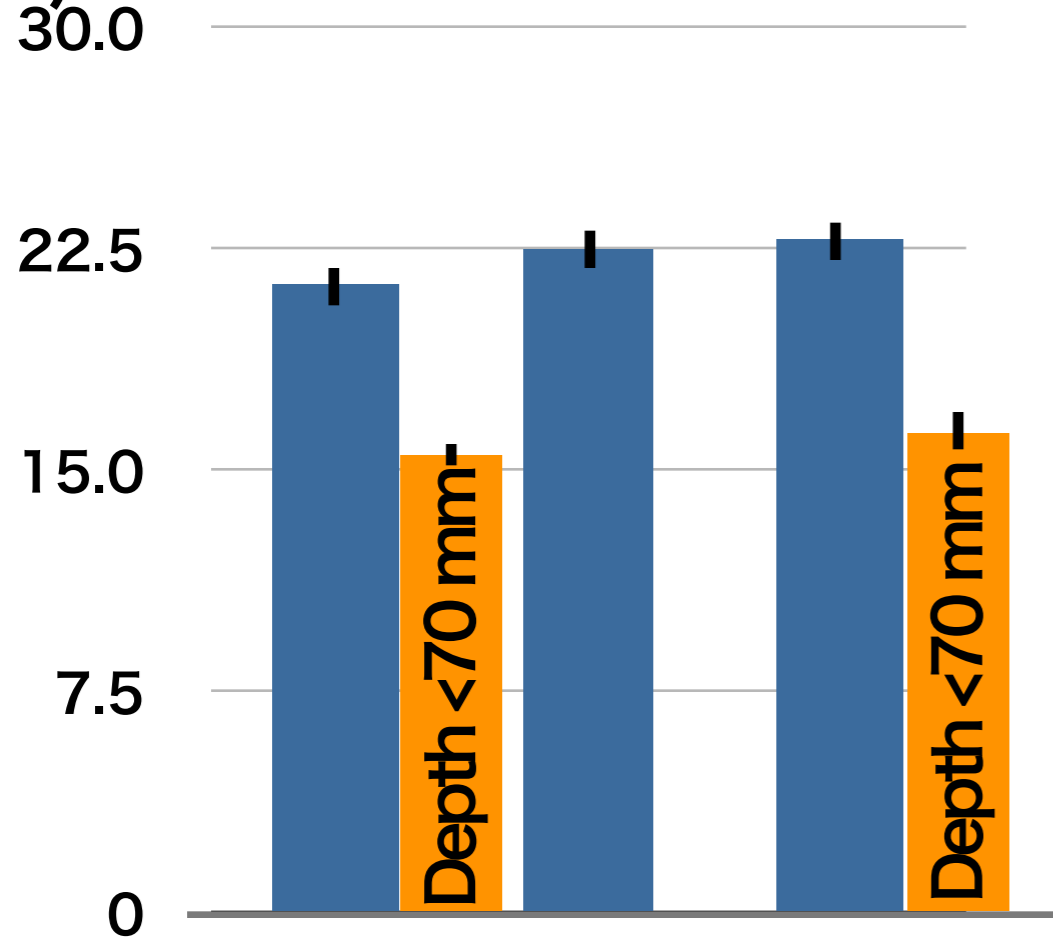

# Efficiency of events having more than 2 clusters.

-SiECAL does not have one-cluster events with two photon distance greater than 3 cm and many 3 cluster events. This means that SiECAL is tuned to have higher sensitivity toward cluster separation.... although I used same analysis code....?

# Moliere radius of 10 GeV in ECAL

(mm) Radius including 90% energy

SiECAL  
ScECALvirtual5x5  
ScECAL45x5w/Splitting

Default SiECAL

ScECAL w/  
Splitting

Radius including 90% energy (mm)

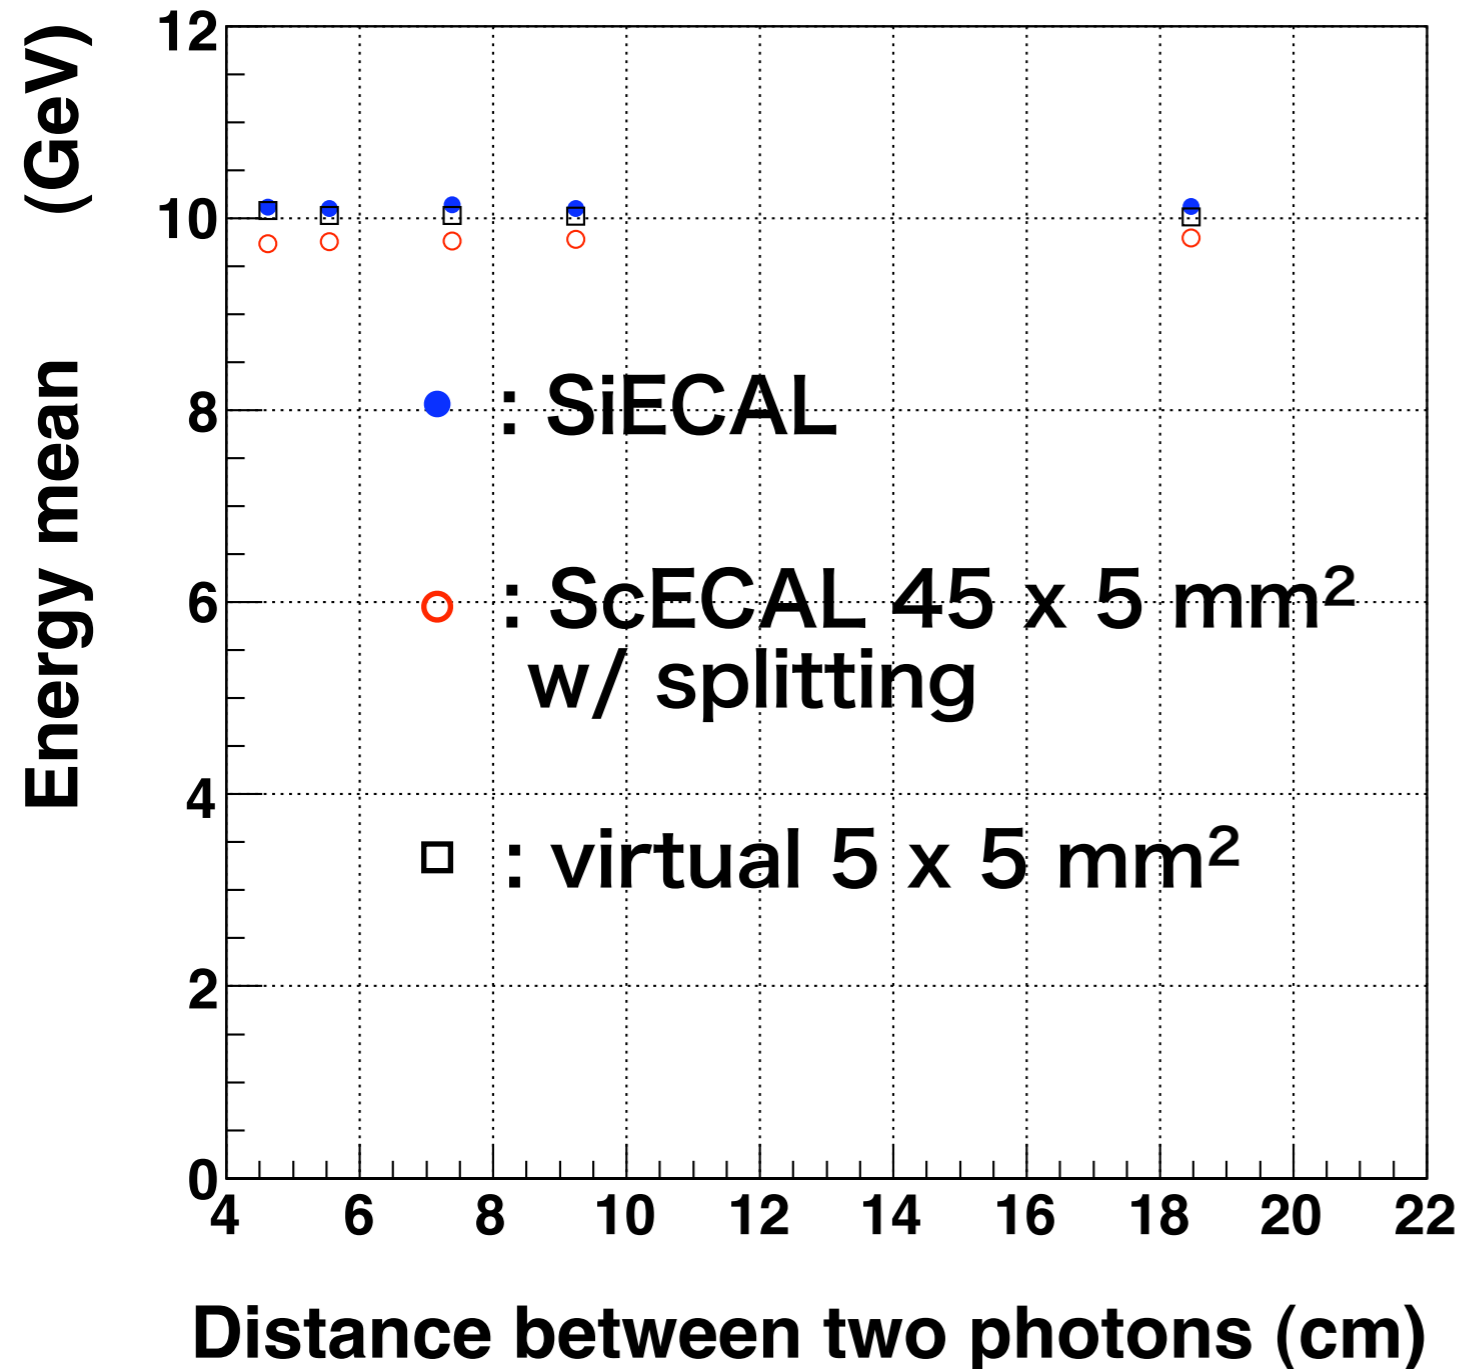

-MPV of Landau-gaussian fit to cluster radius including 90% energy is not so different between SiECAL and ScECAL

# Summary

- Crosscheck for IWLC results have been partially done.
- Strip-Splitting for  $45 \times 5 \text{ mm}^2$  ScECAL with latest mokka and Daniel's code made similar performance to my code.
- Difference between SiECAL and ScECAL still remains.
  - SiECAL and ScECAL do not have large difference of the energy resolution of 10 GeV photon from each other.
  - also cluster radius..
  - But ... Large difference of two cluster separation between Si and ScECAL despite using common cell size ( $5 \times 5 \text{ mm}$ ).
  - I am seeking cause of this difference.

# Mean values of 10 GeV two photon events

RMS90(%)

-45 x 5 mm<sup>2</sup> ScECAL made a little smaller mean value than virtual 5 x 5 mm cell ScECAL. This can be improved by tuning of sensitivity
