

Cherenkov Fast Timing Detectors

Weekly update 07/15/11
Chris Nicholson
Supervisor: Mike Albrow

Goals from last week

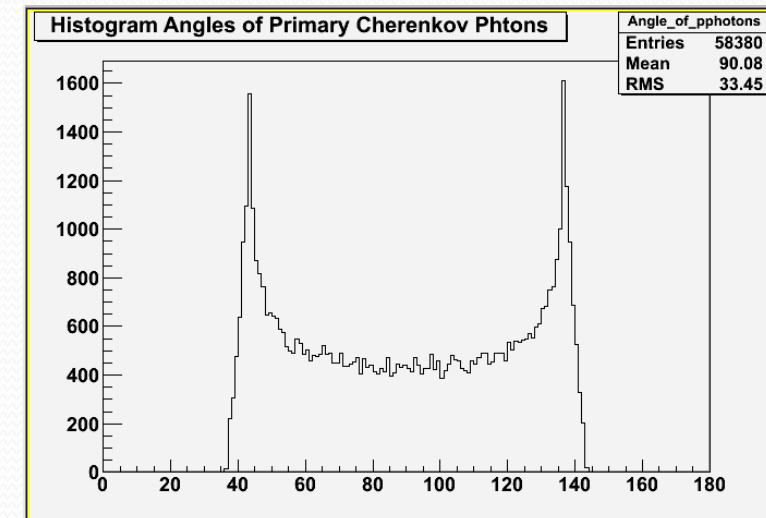

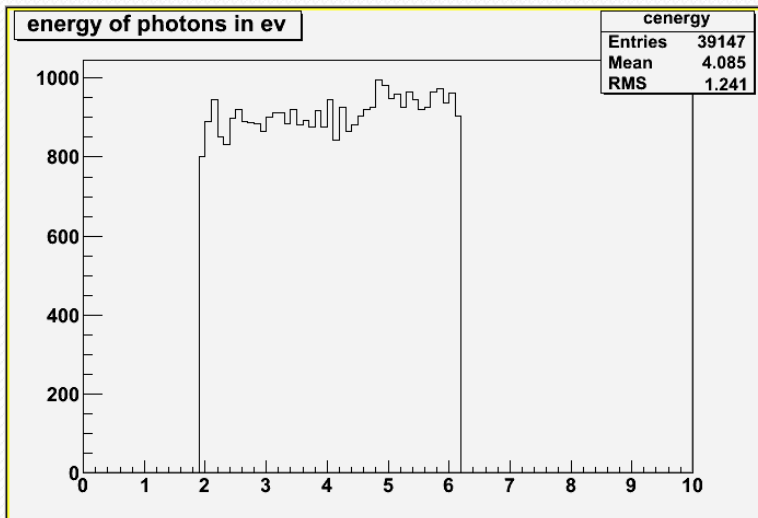

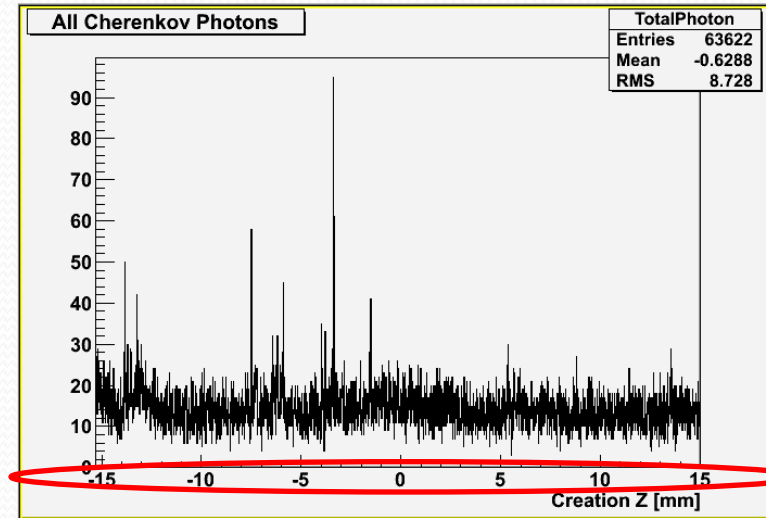

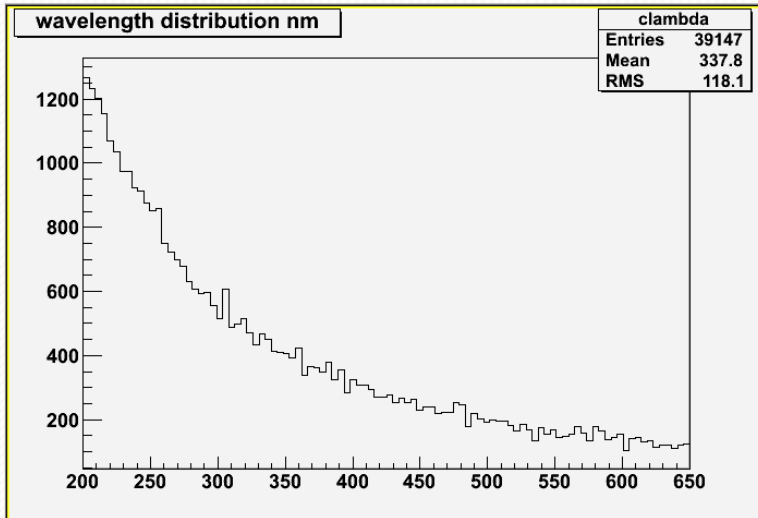

- Finish L-bar construction
- (Visualisation of geometry with light rays)
- Run root analysis investigation of properties
- Analysis of time resolutions of test beam data
- (Pulse height analysis)

L-bar Construction

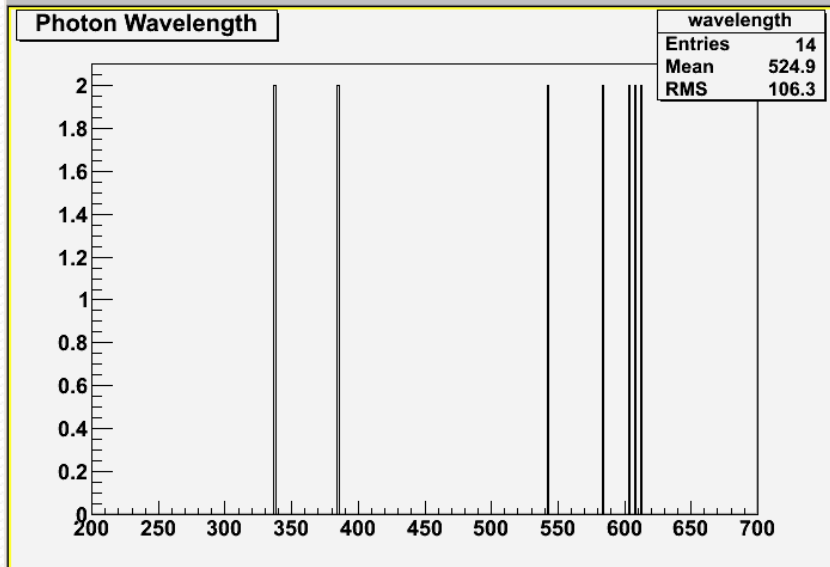

- 25mm long x 25mm high; 3mm x 3mm wide
- SiPM at top
- One question: is “sensitive detector” at same position as SiPM? Some graphical outputs suggest a problem...

Geant4 Basic Characterisation

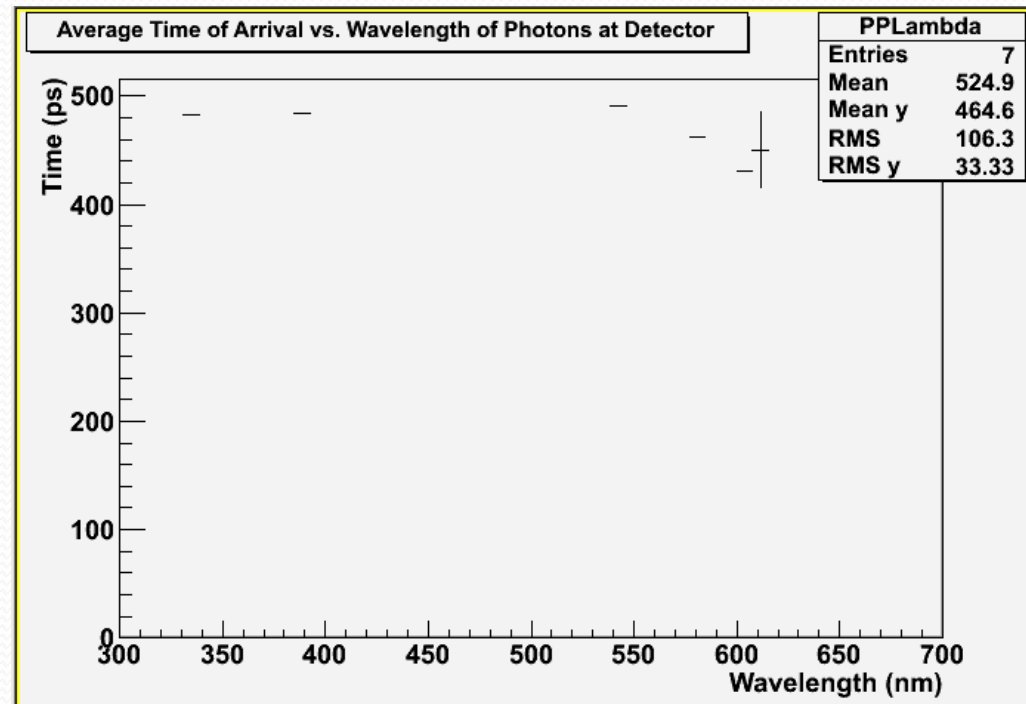

Analysis Graphs

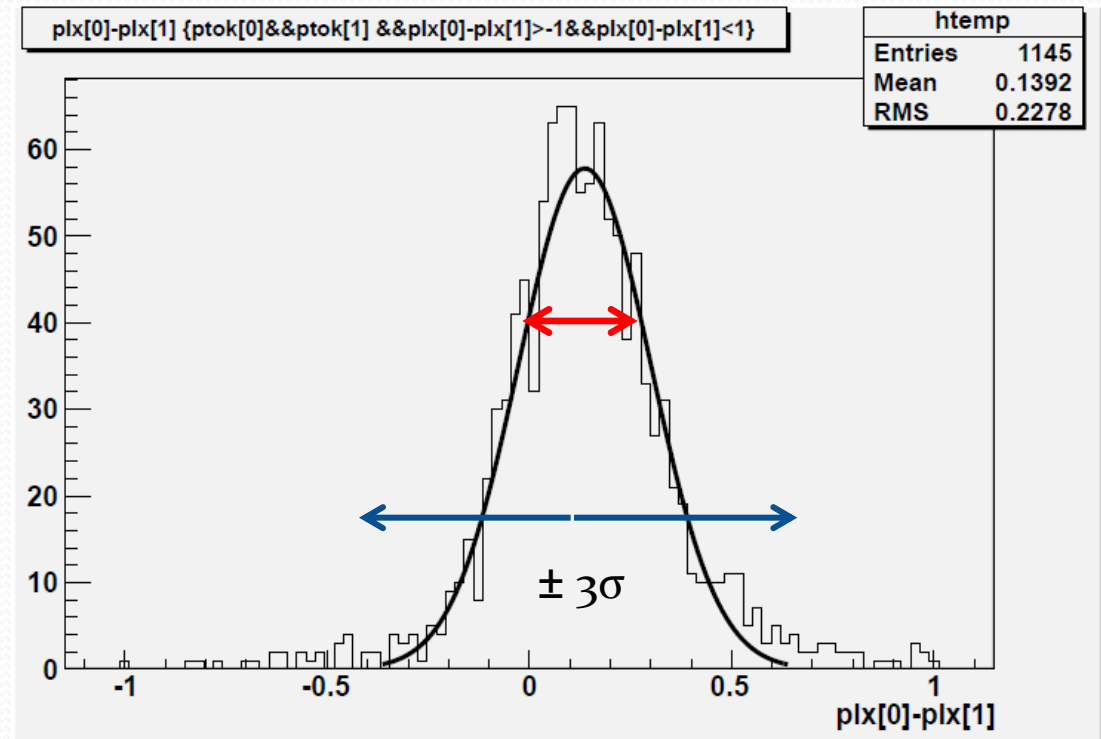

Worries:

- a number of graphs are empty
- Many have only a few entries
- Runs very slowly compared with old code
- Is this really working?

Test Beam Analysis

- Graphs have x-axis in nanoseconds
- Compared resolution between all channels
- Reference channel is Photek 240
- Sigma taken from data of 3sigma of full data range

Distribution of time differences between channels 0 and 1.

Aims for next week

- Be able to look at arrival time vs. wavelength for all photons in Geant4
- Start to optimise dimensions of bar
- Continue analysis of test beam data: tabulate time resolutions and run conditions
