

Recent results from the Tevatron

Wednesday, 25 April 2012 16:00 (40 minutes)

Following the shutdown of the Tevatron in 2011, the CDF and DZero experiments are analyzing the full data set, focusing on those measurements that are unique or that complement the LHC experiments. I will summarize recent results that bear on our understanding of QCD, heavy flavor states, and electroweak symmetry breaking.

Presenter: GRANNIS, Paul (State University of New York)

Session Classification: ACFA Physics
