

Physics Summary at KILC 12

Shinya KANEMURA
University of TOYAMA

Thanks to all 22 speakers

14 Higgs (EWSB) or Higgs related:

H. Ono, J. Tian, C. Calancha, H. Tabassam,
T. Suehara, K. Tsumura, T. Shindou, M. Peskin,
M. Patra, E. Senaha, Y. Kikuta, K. Yagyu,
T. Nabeshima, O. Stal

6 Others:

R. Katayama, M. Berggren,
B. Vormwald, R. Poeschl & V. Marcel,
R Godbole, S. Choi

Tevatron: P. Grannis

CLIC: F. Simon

11 Experimentalists

11 Theorists

Current Status

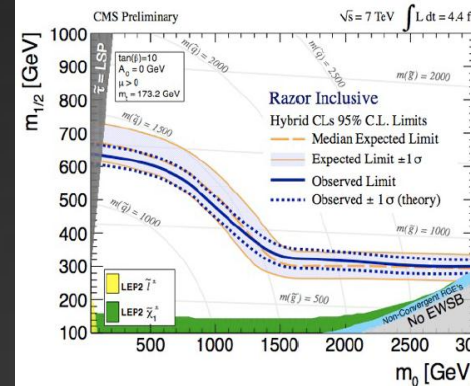

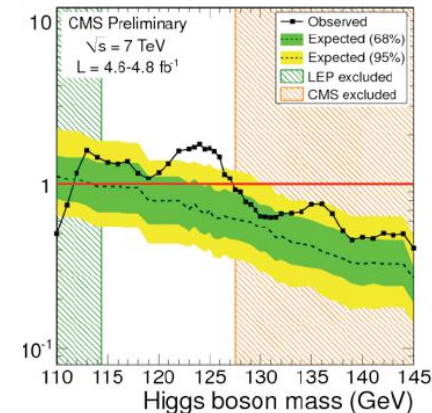

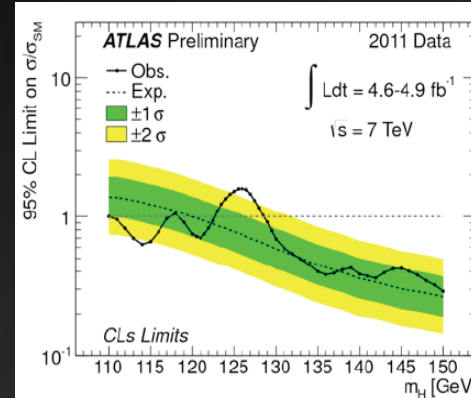

Higgs mass is strongly constrained to be around 115-127 GeV

(Higgs around 125 GeV ?)

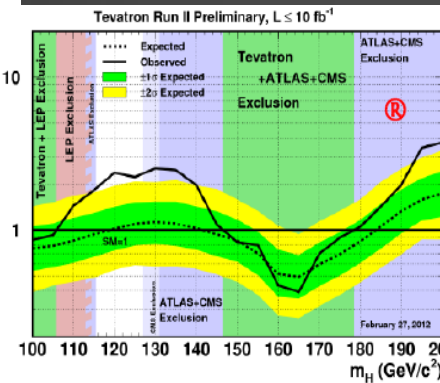

No new (colored) particles found below about 1 TeV

Data consistent with SM

Victory of our Standard Model?

[T.J. Kim]

[Grannis]

Why still new physics?

We all know the SM must be replaced by a model of new physics beyond the SM

Reasonable motivations for BSM

- Theoretical
 - Unification, Hierarchy, Flavor symmetry, ...
- Empirical
 - Neutrino Mass & Mixing, Dark Matter, Baryon Asymmetry of the Universe, ...

All of them cannot be explained in the SM

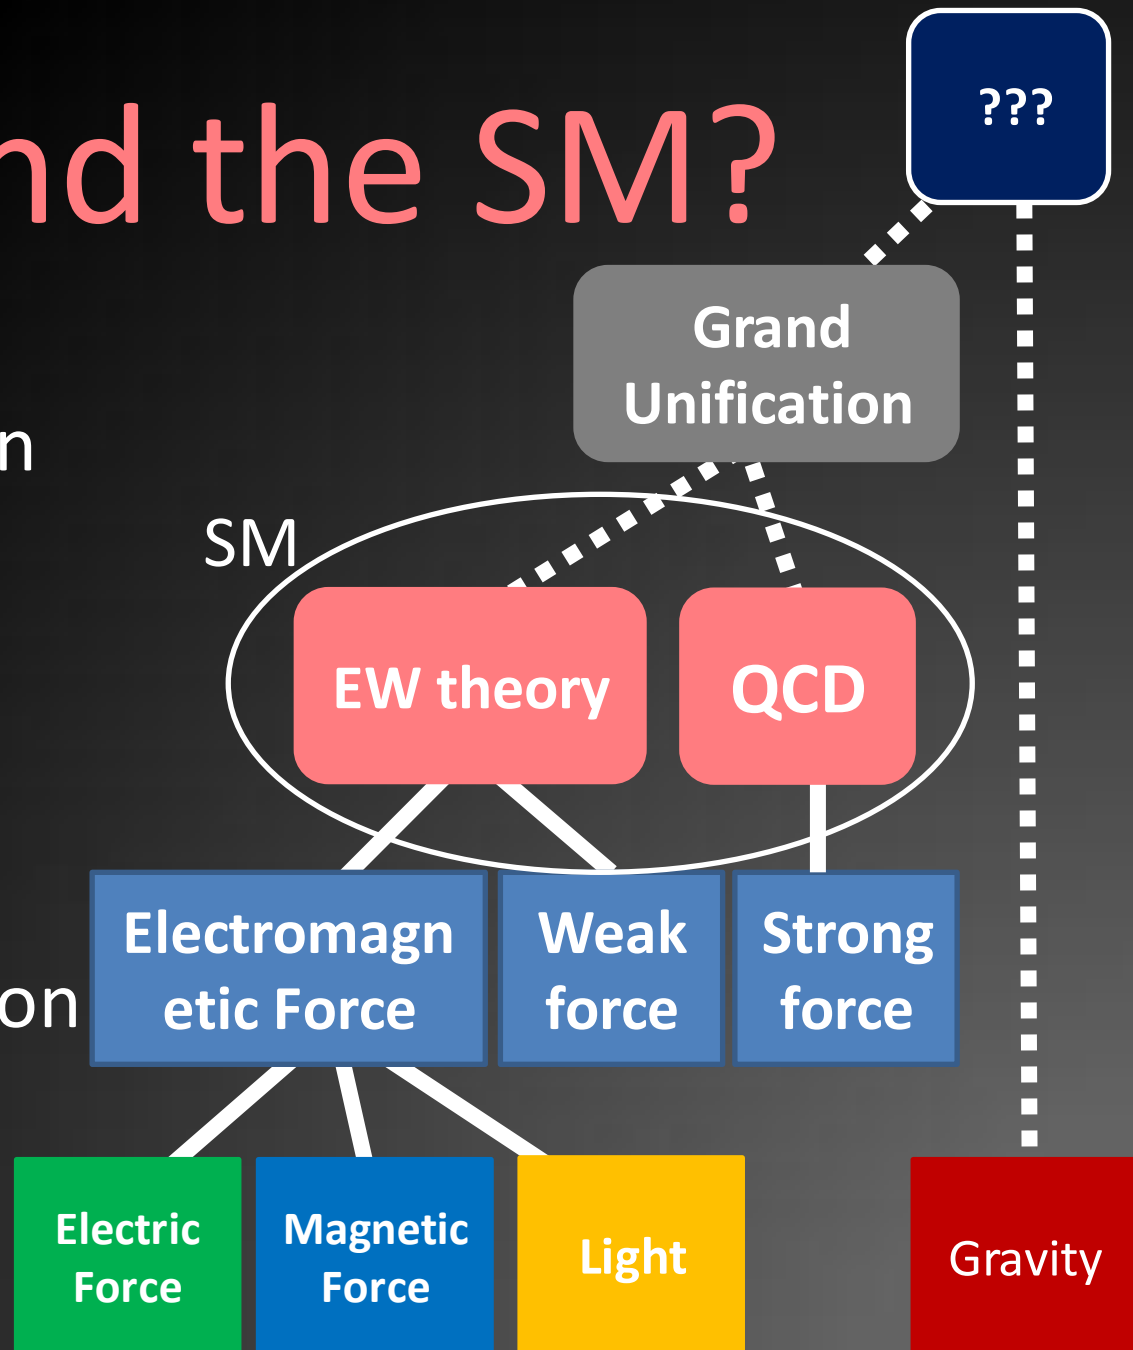

Beyond the SM?

History tells us
unification of low in
the nature

Unification is GOAL

We are still on the
way to the unification

It must be...

Beyond the SM?

Established
Phenomena
Beyond the SM

Baryon
Asymmetry

DM

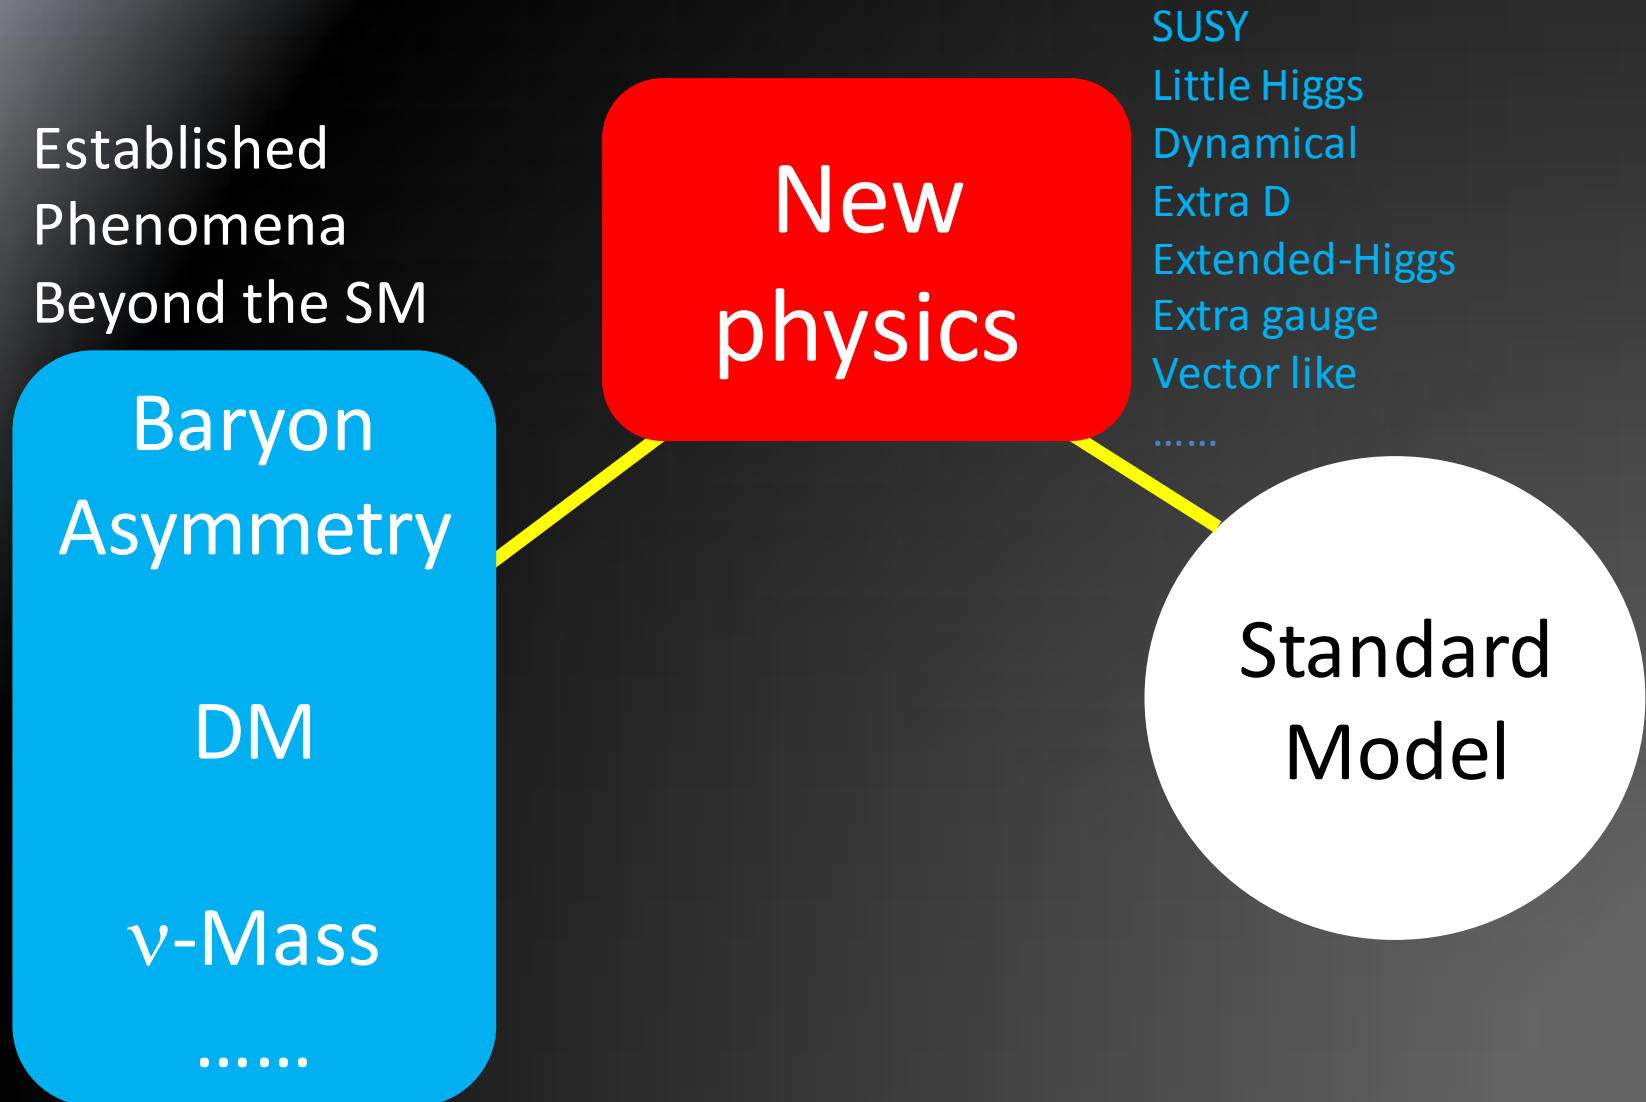

ν -Mass

.....

Not connected

Standard
Model

Beyond the SM?

SM must be replaced

Where is it ?

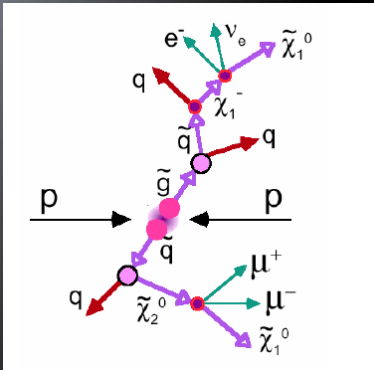

TeV scale? ----- Planck Scale?

Terascale?

- Hierarchy Problem
(Be just above the EWSB scale!)
 - $\Lambda = 1 \text{ TeV}$ mild fine tuning
 - 10 TeV more fine tuning
 - 10^{16} GeV huge fine tuning
- Dark Matter
 - WIMP hypothesis: $m_{\text{DM}} = 1 \text{ GeV} - 1 \text{ TeV}$

NP candidate
SUSY
Little Higgs
Dynamical
Extra D
.....

LHC tells us about SUSY

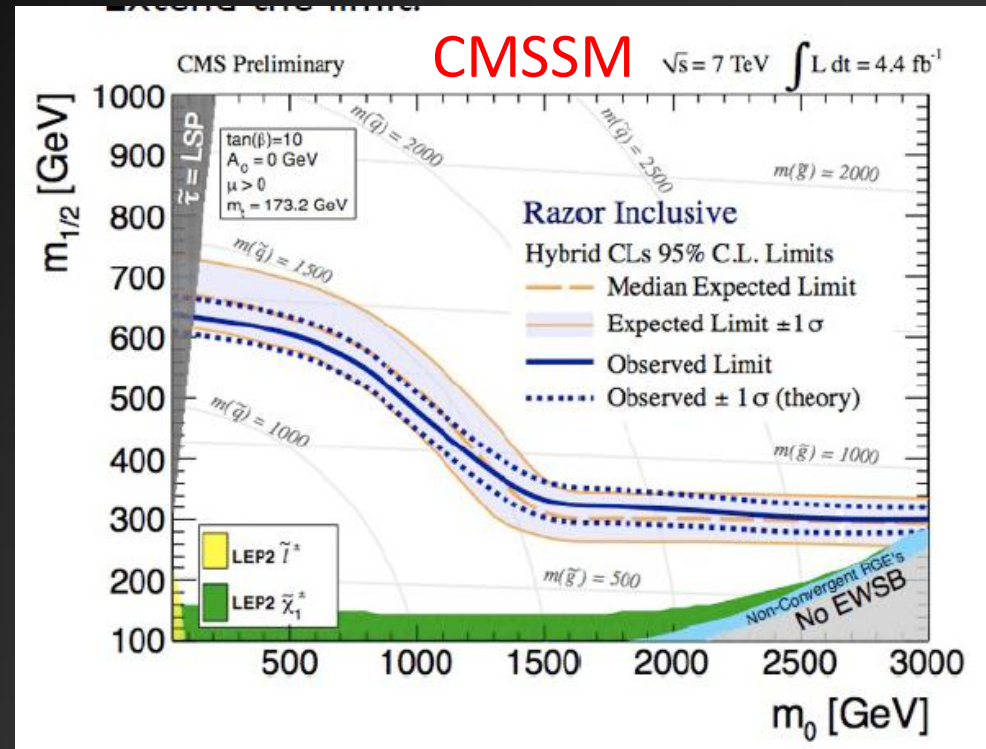

Produce via QCD
process:

gluinos, squarks

Signal:

JETs+MET(+leptons)

No signal found up to now

CMSS-SUS-12-005

[Tae Jeong Kim]

Excluded up to ~ 1.35 TeV for $m(\text{squark}) = m(\text{gluino})$

CMSSM (MSUGRA) is in trouble

It is time to give up on the cMSSM. But what should replace it ?

Here are two options:

1. Find a type of SUSY model in which the mass scale is least constrained by the condition of naturalness.
2. Accept that the theory of electroweak symmetry breaking might involve strong interactions.

Where do these ideas lead ?

Michael Peskin, Summary Talk at LP11, Aug 2011

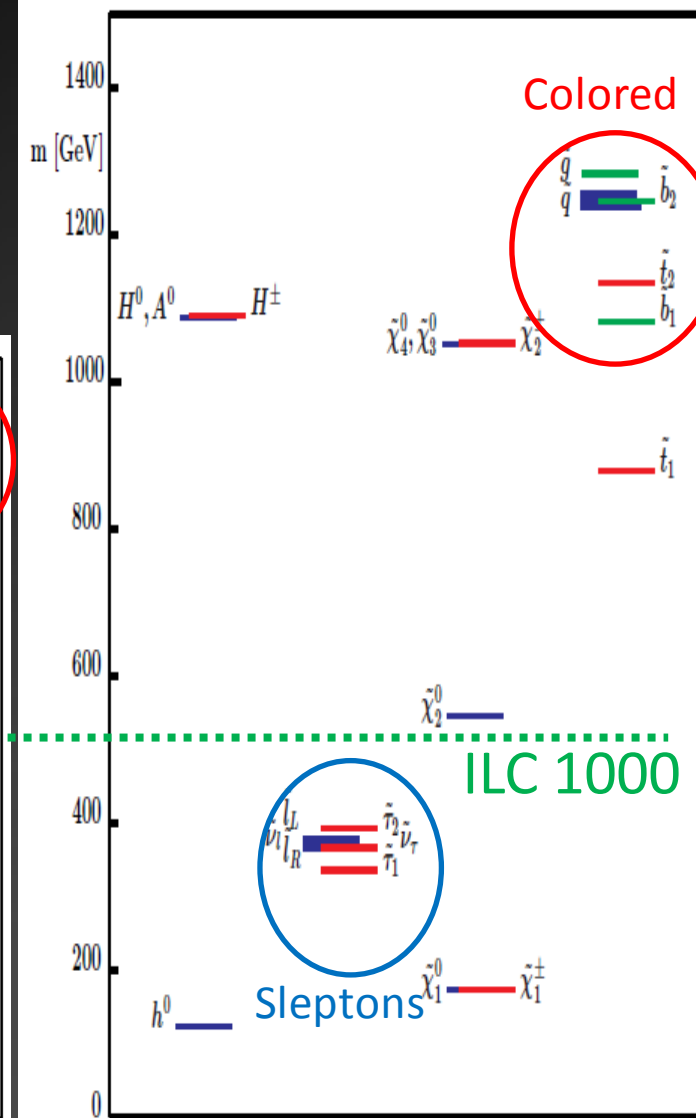

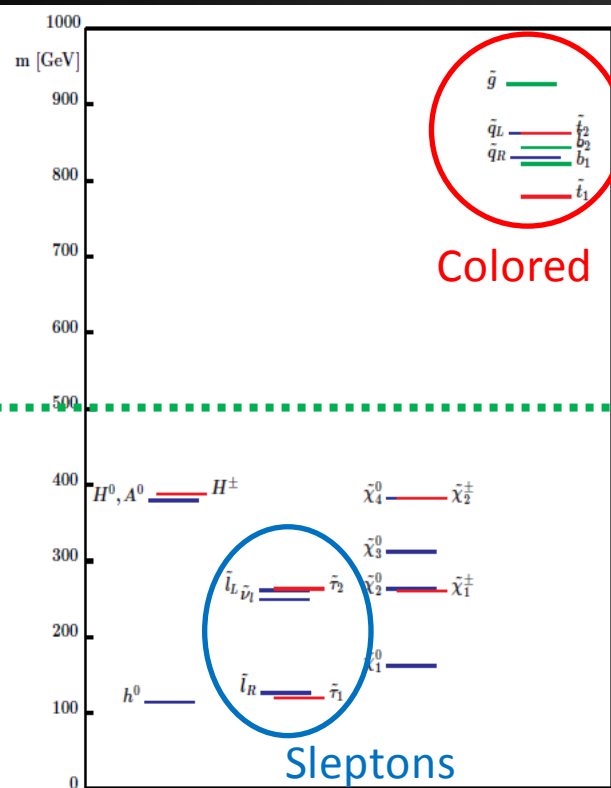

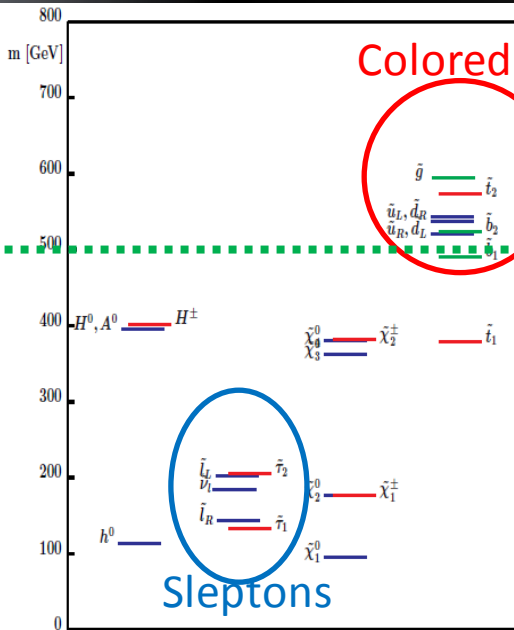

Colored sparticles are constrained from below by LHC

We need mass splitting between the colored sector and the uncolored sector

Typical AMSB scenario

Typical CMSSM scenario

Typical GMSB scenario

S. Heinemeyer

[illegible]

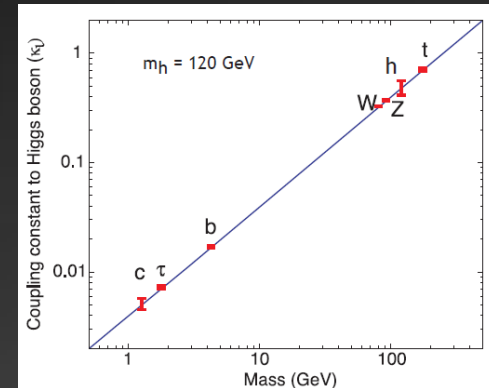

H. Murayama

What is the point?

- It should be $O(1)$ TeV, but ...
- Whether the mass of a new particle is 300 GeV, 500 GeV, 1 TeV, or even 3 TeV strongly depends on the model
- This would be a serious situation from the experimental view point, especially in designing future colliders
- Surely we need luck

Solid target is the Higgs sector

- “Higgs” is really the origin of mass?
- Incomplete part in the SM
 - Gauge interaction is beautiful, but
 - The SM Higgs has no principle (**ugly!**)
 - **Just a guess [Peskin]**
 - Various possibility for (extended) Higgs sectors
- Current data strongly suggest that the Higgs boson is **a light (SM-like) Higgs boson**
 - Notice that **SM-like \neq SM !**

SM Higgs

SM Higgs

$$V(\phi) = -\mu^2 |\phi|^2 + \lambda |\phi|^4$$

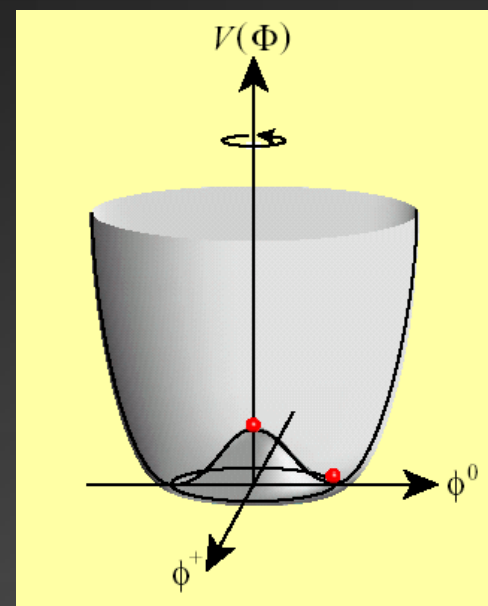

m_h : free parameter

$$m_h^2 = 2 \lambda v^2$$

Hint for the Higgs dynamics

Light Higgs \Leftrightarrow Weakly interacting

Heavy Higgs \Leftrightarrow Strongly coupled

Higgs dynamics determines
the nature of EWSB

But the SM Higgs sector has no principle !!

Higgs and New Physics

What is the essence of the Higgs field?

Higgs nature

\Leftrightarrow

New Physics scenario

- Elementary Scalar?
- Composite?
- Pseudo NG Boson?
- A gauge field in Extra D?
-

Supersymmetry

Dynamical Symmetry Breaking

Little Higgs

Gauge-Higgs unification

.....

Each model has a specific Higgs sector

Higgs sector = Window to new physics

Extended Higgs sector

- If the Higgs sector contains more than one scalar bosons, possibilities would be
 - SM Higgs doublet + Extra singlet
 - SM Higgs doublet + Extra doublet
 - SM Higgs doublet + Extra triplet
 -

Nabeshima

Tsumura

Yagyu

Higgs dynamics

There are possibilities

(1) Light (125GeV) Higgs
with weakly interacting

T. Shindou

Standard SUSY models,
Gauge-Higgs Unification

If there is the principle for $m_h^2 \neq \lambda v^2$ then

(2) Light (125GeV) Higgs
with strongly coupled

Higgs as pseudo scalar
(Little Higgs, Holographic Higgs, ...)
SUSY with extra Chiral superfields
Electroweak Baryogenesis

How we distinguish ?

M. Patra, Y. Kikuta, E. Senaha

Precision measurement of h !!

Decoupling/Non-decoupling

Decoupling Theorem

Appelquist-Carazzone 1975

New phys. loop effect in observables

$$1/M^n \rightarrow 0 \quad (\text{decouple for } M \rightarrow \infty)$$

Violation of the decoupling theorem

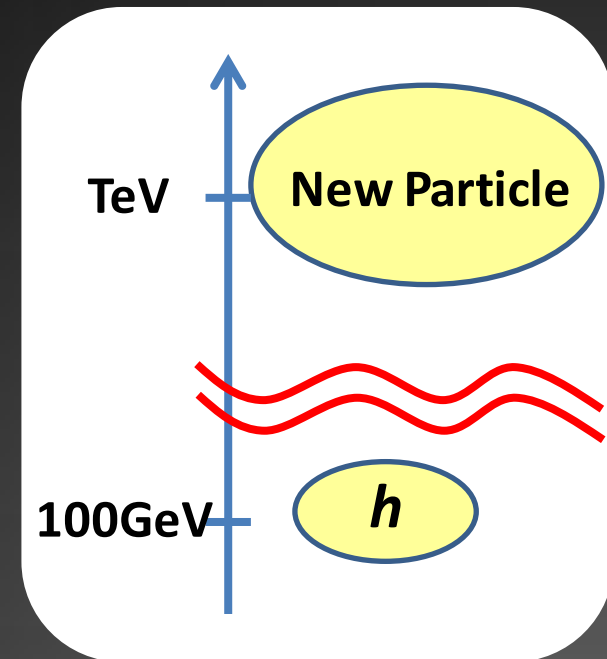

- Chiral fermion loop (ex. Top, 4th gen.)

$$m_f = y_f v$$

- Boson loop (ex. H^\pm in non-SUSY 2HDM)

$$m_\phi^2 = \lambda_i v^2 + M^2 \quad (\text{when } \lambda v^2 > M^2)$$

Non-decoupling effect

Non-decoupling effect

Example (Electroweak T parameter)

$$\rho = \frac{m_W^2}{m_Z^2 \cos^2 \theta_W}, \quad \Delta\rho = \rho - 1 = \alpha T$$

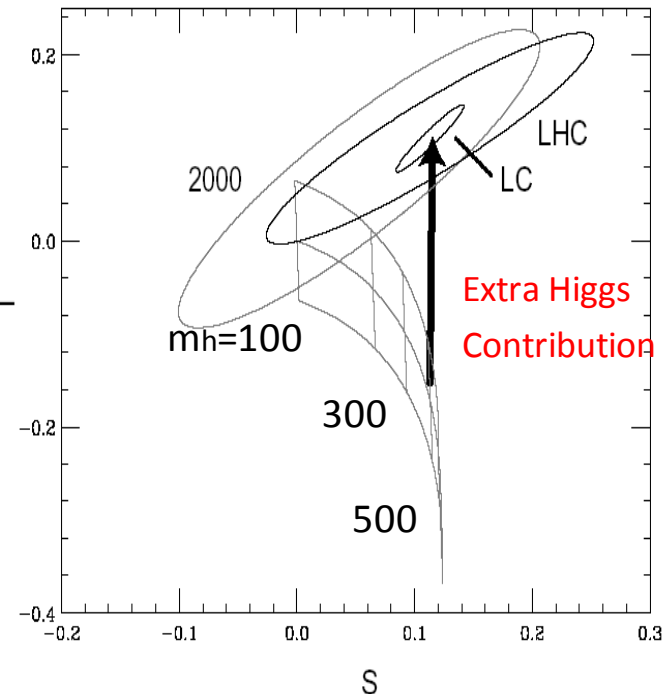

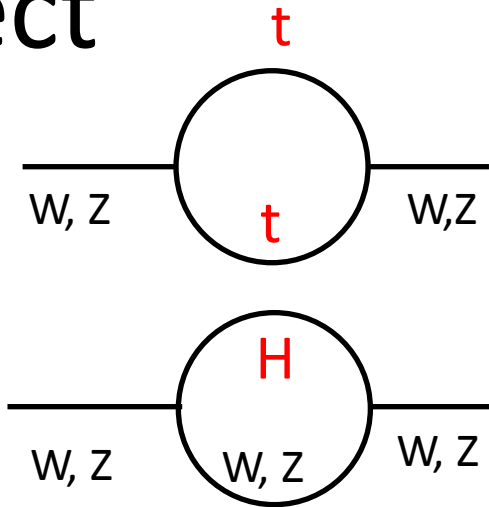

Data $|T| < 0.1$

$$\Delta T_{\text{top}} \propto \frac{m_t^2}{M_W^2}$$

$$\Delta T_{\text{Higgs}} \simeq -\ln \frac{m_H^2}{M_W^2} \quad (\text{SM})$$

$$\Delta T_{\text{Higgs}} \sim -\ln \frac{m_h^2}{M_W^2} + \frac{(m_A^2 - m_{H^\pm}^2)^2}{M_W^2 m_A^2} \quad (2\text{HDM})$$

Quadratic mass contribution
(non-decoupling effect)

Higgs potential

To understand the essence of EWSB, we must know the self-coupling in addition to the mass independently

$$V_{\text{Higgs}} = \frac{1}{2} \underline{m_h^2} h^2 + \frac{1}{3!} \underline{\lambda_{hhh}} h^3 + \frac{1}{4!} \lambda_{hhhh} h^4 + \dots$$

Effective potential $V_{\text{eff}}(\varphi) = -\frac{\mu_0^2}{2} \varphi^2 + \frac{\lambda_0}{4} \varphi^4 + \sum_f \frac{(-1)^{2s_f} N_{C_f} N_{S_f}}{64\pi^2} m_f(\varphi)^4 \left[\ln \frac{m_f(\varphi)^2}{Q^2} - \frac{3}{2} \right]$

Renormalization Conditions $\left. \frac{\partial V_{\text{eff}}}{\partial \varphi} \right|_{\varphi=v} = 0, \quad \left. \frac{\partial^2 V_{\text{eff}}}{\partial \varphi^2} \right|_{\varphi=v} = m_h^2, \quad \left. \frac{\partial^3 V_{\text{eff}}}{\partial \varphi^3} \right|_{\varphi=v} = \lambda_{hhh}$

SM Case

$$\lambda_{hhh}^{\text{SMloop}} \sim \frac{3m_h^2}{v} \left(1 - \frac{N_c \textcolor{red}{m}_t^4}{3\pi^2 v^2 m_h^2} + \dots \right)$$

Non-decoupling effect

Non-decoupling effect

$h \rightarrow gg$ (loop induced)

$h \rightarrow \gamma\gamma$ (loop induced)

Logarithmic non-decoupling effect
can give O(10)% corrections
(ex. Extra scalars)

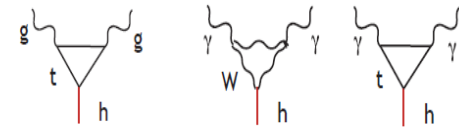

In these vertices (esp. gg), the effect
of vector-like particles can also be
relatively large (5-10 % level) [Peskin]

These effect probably cannot be
seen at the LHC but will be visible at
the ILC

Now we discuss more specifically the loop-induced decays

$$h \rightarrow gg, h \rightarrow \gamma\gamma, h \rightarrow \gamma Z^0$$

In the Standard Model, these decays go through

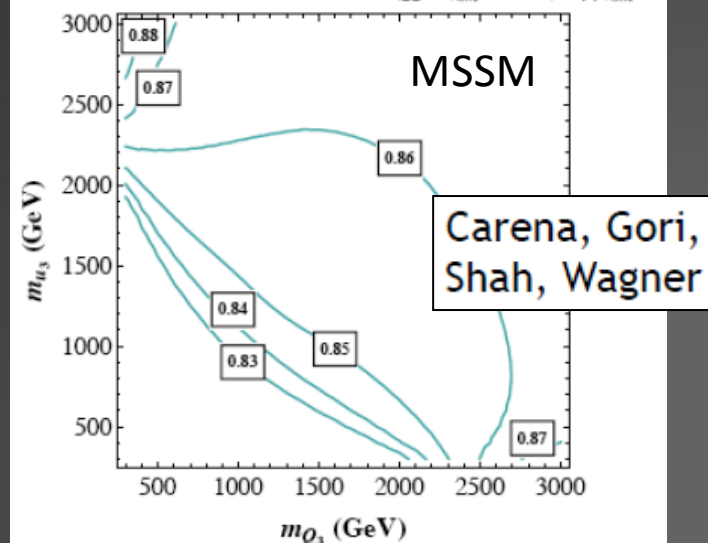

$$\Gamma(h \rightarrow gg) = \frac{\alpha_s^2}{576\pi^2 s_w^2} \frac{m_h^3}{m_W^2} \cdot 2$$

$$\Gamma(h \rightarrow \gamma\gamma) = \frac{\alpha_s^2}{576\pi^2 s_w^2} \frac{m_h^3}{m_W^2} \cdot \left| \frac{21}{4} - 3\left(\frac{2}{3}\right)^2 \right|^2$$

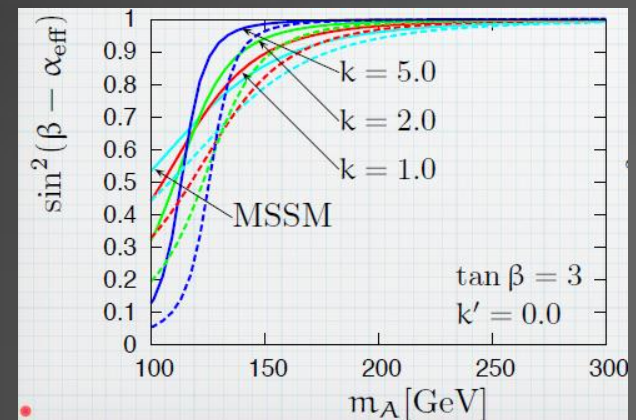

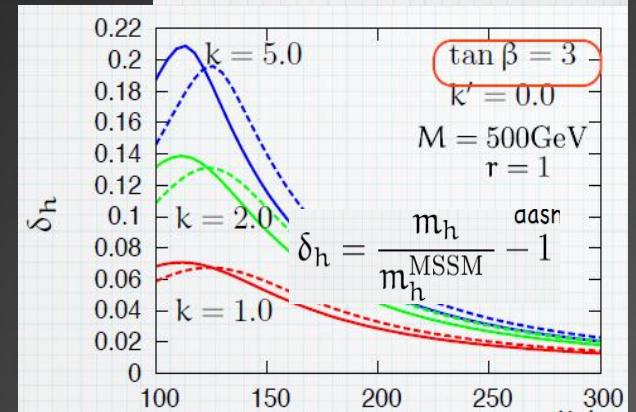

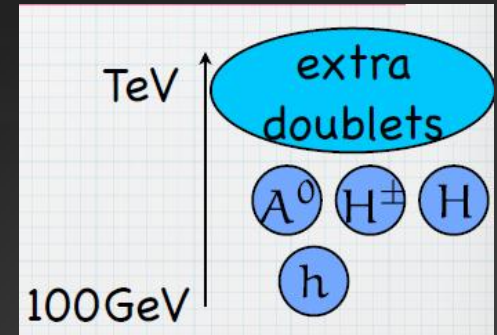

$m_h \ll 2m_W$

$$A_t = 2.5 \text{ TeV}, \tan \beta = 10, \frac{\sigma(gg \rightarrow h)}{\sigma(gg \rightarrow h)_{\text{SM}}} \times \frac{\text{Br}(h \rightarrow \gamma\gamma)}{\text{Br}(h \rightarrow \gamma\gamma)_{\text{SM}}}$$

Extended Higgs sector

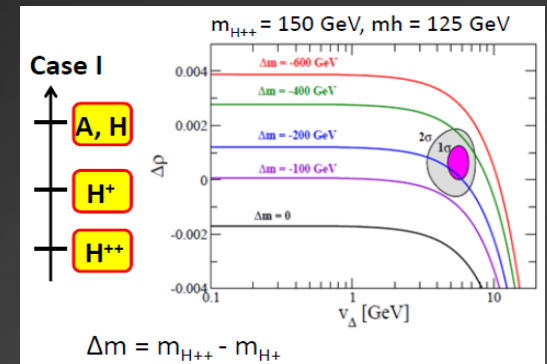

- SUSY 4HDM (Shindou)
 - Quasi-nondecoupling effect due to the B-term between the first two doublets and the rest two.
 - Deviation from the MSSM predictions can be significant
 - O(10) % deviation (m_h , hVV)
- Higgs Triplet model (Yagyu)
 - Type II Seesaw model
 - At tree, $\rho \neq 1$.
 - Study of radiative correction
 - Prediction on $h\gamma\gamma$ (-40%) and hhh (>20%)

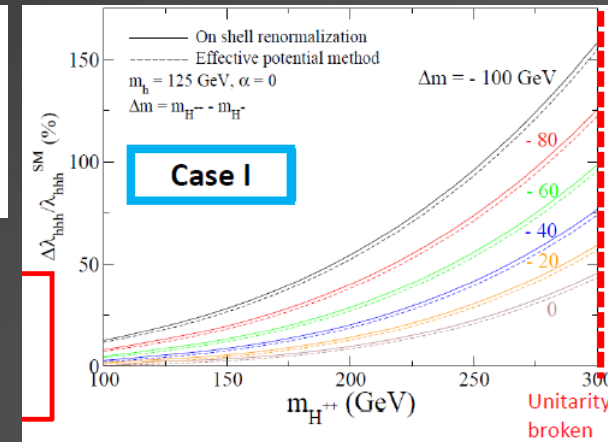

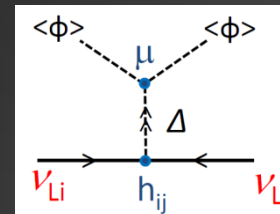

Extended Higgs sector

- SUSY 4HDM (Shindou)
 - Quasi-nondecoupling effect due to the B-term between the first 2 doublet and the rest 2.
 - Deviation from the MSSM predictions can be significant
 - O(10) % deviation

$$(m_\nu)_{ij} = h_{ij} \frac{\mu \langle \phi^0 \rangle^2}{M_\Delta^2} = h_{ij} v_\Delta$$

- Higgs Triplet model (Yagyu)
 - Type II Seesaw model
 - At tree, $\rho \neq 1$.
 - Study of radiative correction
 - Deviation in $h\gamma\gamma$ (>10%) and hhh (>20%)

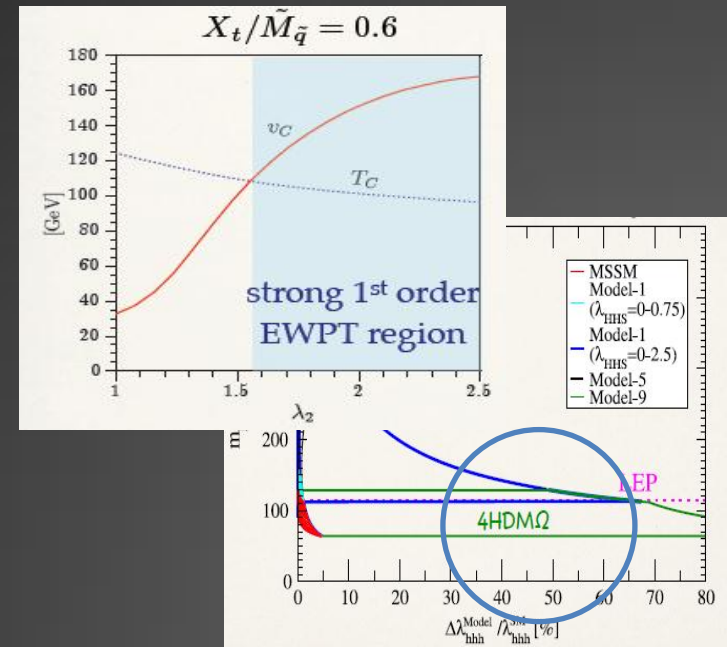

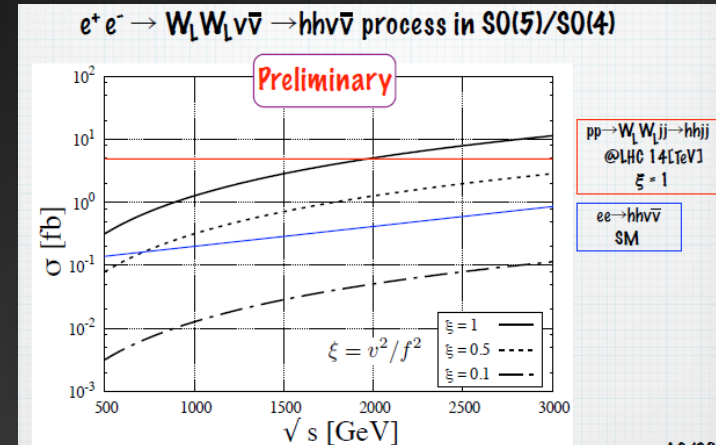

Extended Higgs sector

- Strongly interacting light Higgs (pseudo NG) with N-doublets [Kikuta]

$W_L W_L \rightarrow W_L W_L, Z_L Z_L, hh, HH, AA, \dots$
Collider physics underway

- New SUSY extended Higgs model for Electroweak Baryogenesis [Senaha] (4HDM+ Ω (charged singlets))
 - A 125 GeV Higgs with the strong coupling of the new F-term
 - Strongly 1st Order Phase Transition realized by non-decoupling effect
 - Prediction on hhh (>40% deviation from the SM prediction)
 - Connection between Higgs physics and Cosmology!

Higgs coupling measurement

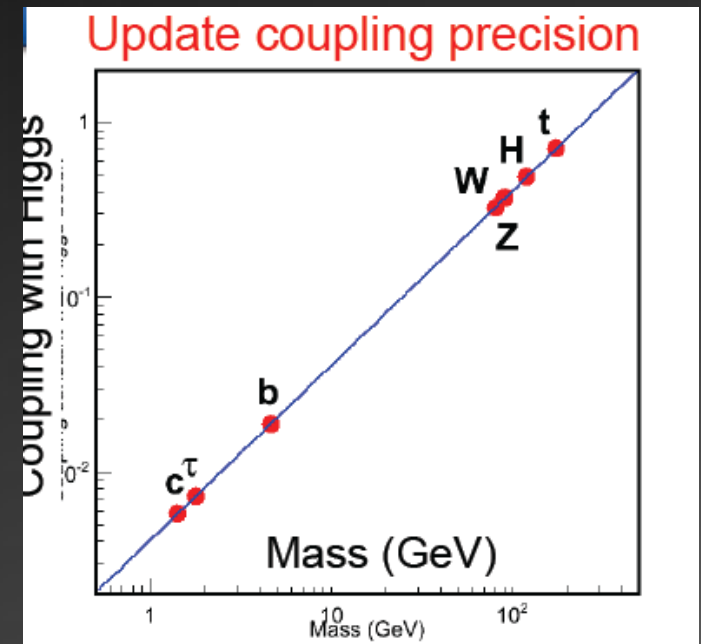

For model discrimination, theorist requires

1 % level precision for
 hWW , hZZ , $h\tau\tau$, hbb , hgg , $h\gamma\gamma$

10 % level for hhh , htt

LHC cannot attain such accuracies...

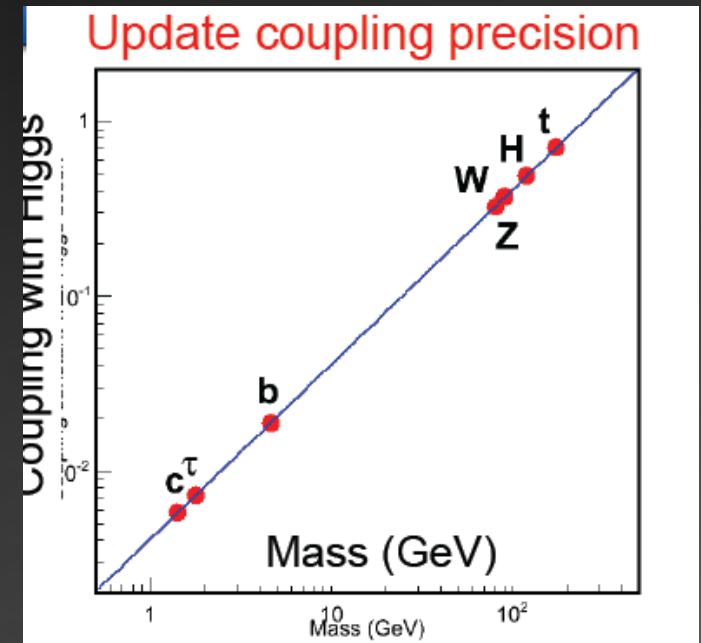

We do hope that LC can reach

Higgs coupling measurement

Simulation Studies

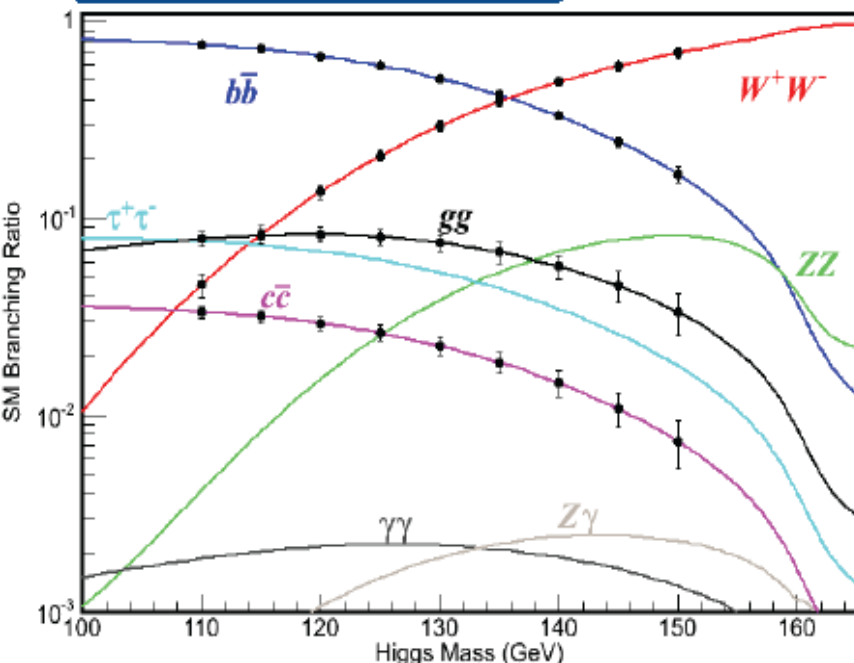

- Higgs branching ratio [Ono]
 $E_{\text{cm}}=250 \text{ GeV}$, $L=250\text{fb}^{-1}$
Higgsstrahlung (ZH)
 $WW^* \rightarrow 4q, l\nu qq$ $\Delta\text{Br}/\text{Br} \sim 8\%$
- HWW coupling (Tian)
 $E_{\text{cm}}=500\text{GeV}$, $L=500 \text{ fb}^{-1}$, W-fusion
 $\Delta g/g \sim 1.4\%$, $\Delta\Gamma/\Gamma \sim 5\%$
W polarization can also be measured
- $H\gamma\gamma$ coupling [Calancha]
 $E_{\text{cm}} = 250 \text{ GeV}$, $L=250 \text{ fb}^{-1}$
Challenging, Underway for DBD

Summary table of Higgs BR study

$E_{cm}=250\text{ GeV}, L=250\text{fb}^{-1}, P(e^+,e^-)=(+0.3, -0.8) \text{ or } (-0.3, +0.8)$

Higgs BR v.s. M_H

Scale from 120 GeV results

Mh	120 GeV			125 GeV		
σ (fb)	354.1 fb			279.9 fb		
H decay	BR	$\sigma \times \text{BR}$	$\Delta \text{BR} / \text{BR}$	BR	$\sigma \times \text{BR}$	$\Delta \text{BR} / \text{BR}$
$H \rightarrow b\bar{b}$	64.1%	227.1	2.7%	59.5%	188.6	3.0%
$H \rightarrow c\bar{c}$	3.1%	10.8	8.1%	2.6%	8.3	9.1%
$H \rightarrow g g$	7.0%	24.9	9.0%	8.0%	25.5	9.6%
$H \rightarrow W W^*$	15.0%	35.3	8.4%	20.8%	43.2	7.2%
$H \rightarrow \tau \tau$	8.7%	30.9	TBD	6.1%	19.4	
$H \rightarrow Z Z^*$	1.7%	6.1	Ono	2.6%	8.1	
$H \rightarrow \gamma \gamma$	0.27%	0.95	Tino	0.2%	0.7	
$H \rightarrow Z \gamma$	0.13%	0.45	Tino	0.2%	0.5	

Assuming σ_{ZH} uncertainty: $\Delta \sigma / \sigma = 2.5\%$

Whizard+pythia and HDECAY

Higgs coupling measurement

Simulation Studies

- Higgs self-coupling (hhh) [Suehara]

$$E_{\text{cm}} = 500 \text{ GeV}, L = 500 \text{ fb}^{-1}$$

HHZ coupling sensitivity 57% (2011)

Under Improvement by developing
jet clustering, vertex finder,... toward DBD

- Top Yukawa coupling [Tabassam]

$$E_{\text{cm}} = 500 \text{ GeV} \text{ (1 TeV)}, L = 1 \text{ ab}^{-1}$$

$$e^+ e^- \rightarrow \bar{t} t H \rightarrow \bar{b} W^- b W^+ \bar{b} b$$

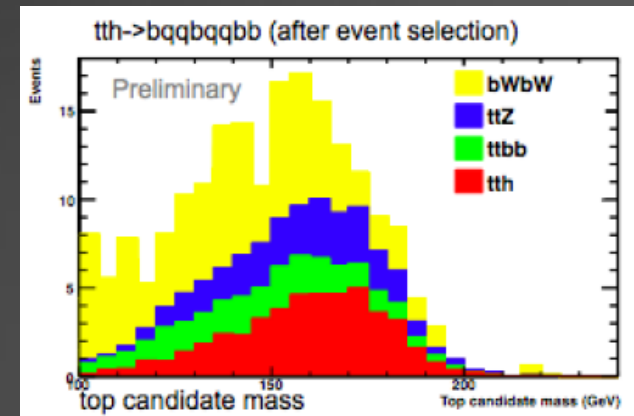

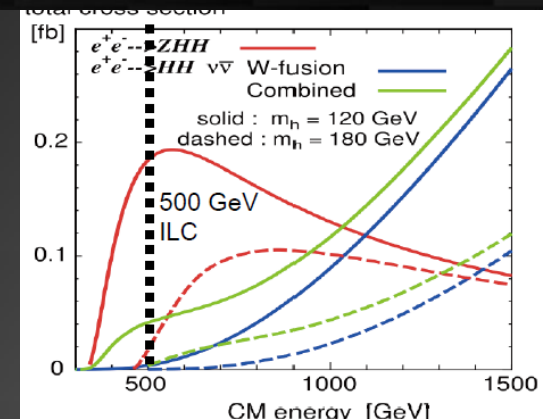

Signal yield: 29

Background: 33(ttbar), 24(ttZ), 24(ttbb)

Significance ~ 2.9 (stat.)

Full simulation underway toward DBD

Tiny cross section of **0.2fb**
(and **only half** contribute to
self coupling diagram)
Background (top-pair, ZZH etc.)
must be very strongly suppressed

Direct searches of additional scalars

Leptophilic (type X) 2HDM [Tsumura]

- For neutrino mass, dark matter, ...
- Discussed difference from MSSM-like (type II) 2HDM

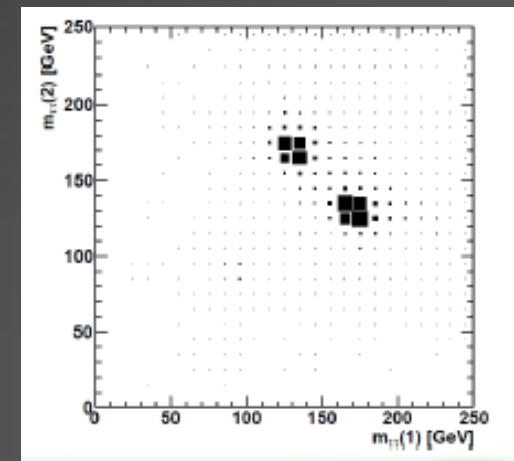

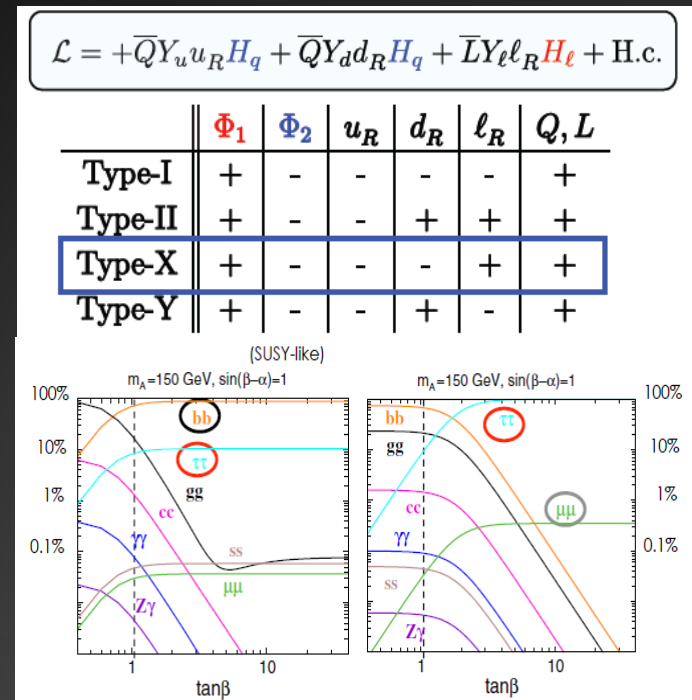

HA production at LHC vs ILC

HA \rightarrow 4 tau signal

Simulation study

- At LHC endpoint analysis
- At ILC invariant mass analysis with colinear approx.

Direct probe of the pair production

Outlook

- A light Higgs boson seems suggested from current data
- No new particle has been found yet
(We do not know the scale where new particle appears)
- Where we go?
 - SM Higgs has no principle, but nature seem to suggest “SM-like” Higgs boson (SM-like \neq SM)
 - various possibilities for extended Higgs
- Higgs sector can be reached at the LHC
- But precision measurement of the Higgs sector will be possible only at LC Higgs factory (0.25-0.5 TeV)
- Energy extension to 1 or muliti-TeV (hhh , htt)

Higgs as a probe of new physics

Thank you for all the speakers again!
