**The list was SAD definition.
(K1/2 or K2/2)**

*Nominal --- Nominal Optics presented
by T. Okugi at 9/14.*

*Ver.5 --- Ver5 Optics presented
by G. White at 9/21
(rematched to IP with QF21X and QMs)*

FF quadrupoles are same strength for both optics.

*EXT quads and matching quads and FF sextupoles are different setting
as G.White's presentation at 9/21.*

Beam Size Simulation for Optics Ver5

	σ_x (rms)	σ_x (core)	σ_y (rms)	σ_y (core)
w/o multipole errors no correction	8.64um	8.47um	35.3nm	34.7nm
with multipole errors before optimization	8.64um	8.47um	40.0nm	38.3nm
with multipole errors after 6pole optimization	8.64um	8.47um	34.9nm	34.4nm

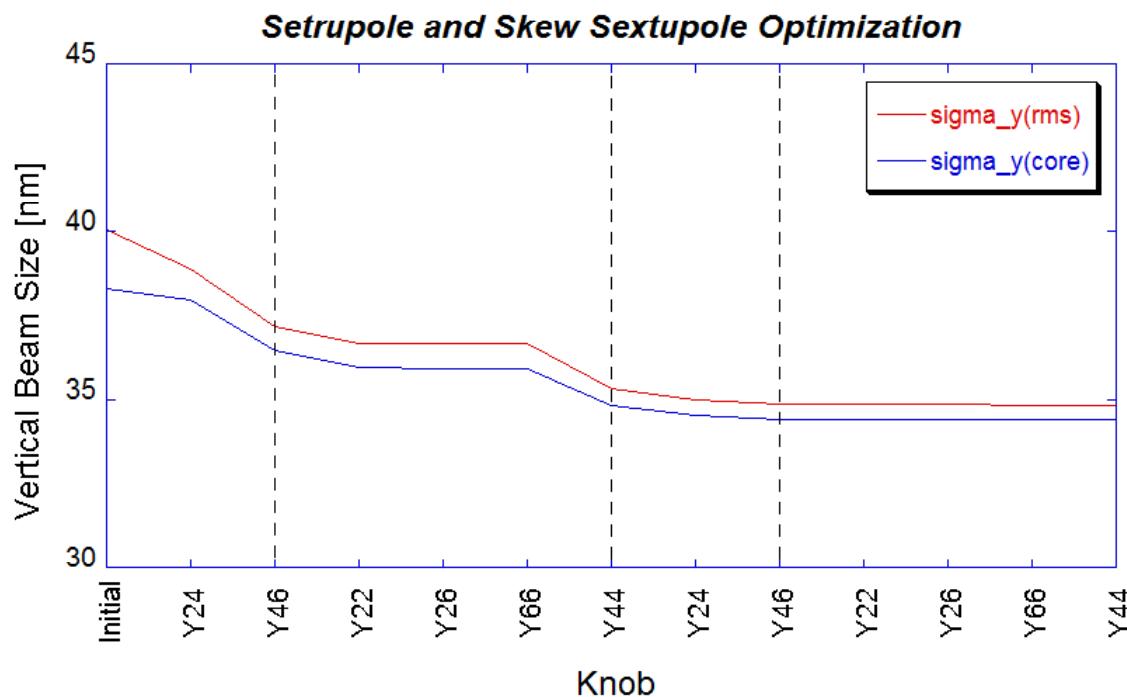

Input beam parameters

$$\text{emitx} = 2\text{nm}$$

$$\text{emity} = 12\text{pm}$$

$$\sigma p/p = 0.08\%$$

FF sextupole Strength (SAD definition; K2/2)

	Before optimization	After optimization
SF6FF	4.2823	4.2787
SF5FF	-0.3954	-0.4088
SD4FF	7.4550	7.6153
SF1FF	-1.2890	-1.2986
SD0FF	2.1559	2.2002
SK4FF	0.0000	0.0295
SK3FF	0.0000	0.0219
SK2FF	0.0000	0.1184
SK1FF	0.0000	-0.0046

Summary

Strengths of FF quadrupole magnets are same for both nominal optics and optics deck ver.5.

The vertical beam size can be squeezed to 34nm by applying the corrections of sextupole and skew sextupole strengths.

I also recommend to use the Ver.5 optics at the beginning of 2012 autumn run.
