

Maintenance of jlccpuss02

One of 2 raid disks, which was mounted as /data14, /data1/data16 by jlcclogin2 and jlcclogin3, a couple of months ago. Rebuild failed

But, jlccpuss02 is on now for NFS server of /data17, /data18, /data19.

Plan to repair jlccpuss02 is

- replace raid card, and rebuild
- If not recovered replace several disks and initialize RAID.
- The card will be delivered soon.

For this procedure,

- jlccpuss02 will be out of service.
- To avoid accidental loss of files, files (important) in /data17, /data18, /data19 should be backed up to another places, if any, Owner should backup them by themselves.
- These work may take more than a week.

Can I start this work next week or a week after next week ?
