

Precision measurements of the Top Higgs Yukawa Coupling 1 TeV - Semileptonic

T. Price

International Large Detector

txp@hep.ph.bham.ac.uk

January 25, 2013

Overview

- ① Variables
- ② Cut Based Analysis
- ③ TMVA
- ④ To Do

Input Variables I

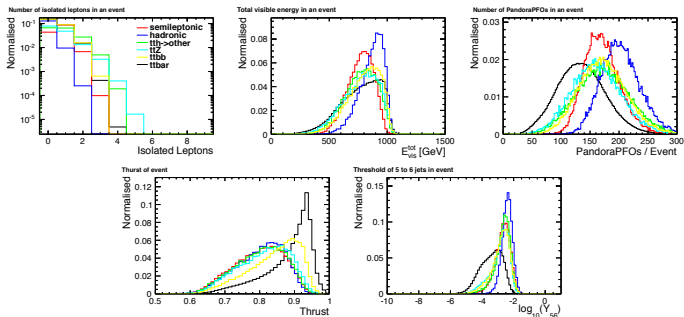

Figure: Normalised histograms of the number of identified isolated leptons (top left), total visible energy (top middle), number of PandoraPFOs (top right), thrust (bottom left), and the jet parameters (bottom right) within the events for the semileptonic (red) and hadronic (blue) modes alongside the backgrounds.

Input Variables II

Figure: Normalised histograms for the response of the b-tagging from LCFIPlus for the highest ranked jet in an event (top left), second highest (top right), third highest (bottom left), and fourth highest (bottom right) for the semileptonic (red) and hadronic (blue) signal modes and all backgrounds.

Input Variables III

Reconstructed Masses

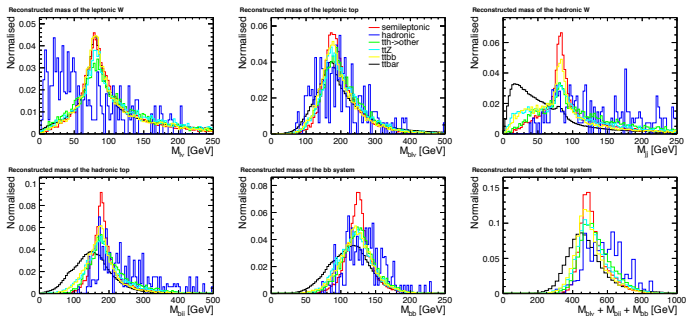

Figure: The reconstructed masses of the leptonic W boson (top left), leptonic top quark (top middle), hadronic W boson (top right), hadronic top quark (bottom left), Higgs boson (bottom middle) and total mass (bottom right) when there is exactly one identified isolated lepton in the event.

Cut Based Analysis I

Cut Flow

Cut	lept	semi	had	other	ttZ	ttbb	tt	$\frac{S}{\sqrt{S+B}}$
Total Events	151.4	628.7	652.7	1046.1	5332.4	1434.5	308800.9	1.11
$N_{\text{isolep}}=1$	74.6	363.5	5.0	371.8	1581.5	439.9	101295.2	1.13
$610 < E_{\text{vis}} < 1000$	49.6	338.5	4.7	312.7	1228.9	373.8	75507.1	1.21
$n\text{PFOs} > 154$	15.0	235.0	4.1	195.0	589.0	194.5	12605.9	2.00
$\text{Thrust} < 0.88$	12.5	205.6	3.7	168.9	492.6	140.0	6092.3	2.44
$\log_{10}(Y_{45}) > -2.25$	7.7	151.3	3.2	108.5	295.2	91.0	2067.2	2.90
$\log_{10}(Y_{56}) > -3.35$	6.9	145.1	3.2	106.2	277.6	86.0	1836.1	2.92
$b\text{-tag}_1 > 0.96$	6.7	135.1	2.8	79.8	216.9	78.3	1367.8	3.11
$b\text{-tag}_2 > 0.91$	6.1	118.2	2.3	41.2	135.1	66.9	715.2	3.59
$b\text{-tag}_3 > 0.67$	5.5	102.1	1.6	5.7	59.4	56.0	137.2	5.33
$b\text{-tag}_4 > 0.04$	5.5	100.5	1.5	5.4	58.3	54.8	128.7	5.34
$\chi^2 < 450$	5.3	100.0	1.4	5.2	56.8	53.7	126.0	5.36
$364 < M_{\text{Total}} < 808$	5.2	99.7	1.4	5.2	56.5	53.5	124.7	5.36
$98 < M_H < 234$	4.6	95.1	1.2	4.7	46.1	48.6	109.9	5.40

Table: The number of events passed each cut when the cut values are optimised to select the semileptonic signal with maximum significance. The $ttH \rightarrow \text{other}$ is the background where the Higgs boson does not decay to a bb pair.

Cut Based Analysis II

Figure: The reconstructed Higgs boson mass for the optimal combination of jets in the semileptonic decay mode for all events (left) and only the events which pass all of the cuts (right).

$$\epsilon_{sig} = 15.1\%, \quad \rho = 30.9\%$$

$$\text{Final significance} = 5.40$$

$$\frac{\Delta g_{ttH}}{g_{ttH}} = 9.6\% \text{ (stat)}$$

Figure: The response of the multivariate analysis for the semileptonic (left) and events passed mva cuts (right).

Final significance = 7.59

$$\frac{\Delta g_{ttH}}{g_{ttH}} = 6.9\% \text{ (stat)}$$

Conclusions

Results

Semileptonic results: 6.9% (9.6%) [TMVA (Cut based)]

Hadronic results: 5.4% (7.2%) [TMVA (Cut based)] T. Tanabe

Combined results: 4.3% for TMVA analysis

To Do

- Update results in note and send to reviewers again
- Update results in DBD
- Combine results with SiD and publish
- Consider systematics

Top Yukawa Coupling at 1 TeV ILC

hadronic “8 jet” channel

Tomohiko Tanabe

January 24, 2013

- Top quark couples strongly to the Higgs boson (top Yukawa $y_t \sim 1$)
- Important probe for verification of electroweak symmetry breaking
- Many BSM models predict **large deviations in y_t** e.g. composite Higgs models

Top Yukawa coupling precision studies at LC

CM Energy	Simulation	Luminosity	$\Delta y_t / y_t$
500 GeV [Phys. Rev. D 84, 014033 (2011)]	Fast Sim	1 ab ⁻¹	10%
500 GeV [R. Yonamine, Ph.D. thesis]	Full Sim	1 ab ⁻¹	10%
700-800 GeV [A. Gay, Eur.Phys.J.C49, 489 (2007)]	Fast Sim	(various Higgs masses)	
1 TeV [ILC TDR, 2012]	Full Sim	0.5 ab ⁻¹ each for 2 polarizations	< 5%

- **Indirect measurement** at the $t\bar{t}$ threshold
 - depends on theory calculation \rightarrow improving
 - can be also inferred from LHC Higgs production

F.Simon Top Phys WS 2012

- **Direct measurement** can distinguish between **coupling anomaly** and **new particle in the loop**

- **Signal:** $t\bar{t}H \rightarrow bWbWbb$
- Irreducible backgrounds:
 - $t\bar{t}Z \rightarrow bWbWbb$
 - $t\bar{t}g^* \rightarrow bWbWbb$
- Reducible background: $bWbW$, e.g. $t\bar{t}$

Estimate effect of non-contributing diagrams.
 Dependence of cross section w.r.t. scaling of top Yukawa
 coupling \rightarrow slope at SM value gives nominal sensitivity

$$\frac{\Delta y_t}{y_t} = \left(\dots \right) \frac{\Delta \sigma}{\sigma} \left(\frac{\sigma / y_t}{|d\sigma / dy_t|} \right)_{y_t = y_t(SM)} = 0.52$$

$m_t=125 \text{ GeV}, \sqrt{s}=1 \text{ TeV}, \text{epol}=-1.0, \text{ppol}=+1.0$

$m_t=125 \text{ GeV}, \sqrt{s}=1 \text{ TeV}, \text{epol}=+1.0, \text{ppol}=-1.0$

- Goal is to evaluate the precision of the top Yukawa coupling at $\sqrt{s} = 1$ TeV
 - = evaluate the precision of cross section measurement
- **Higgs boson mass set to 125 GeV in light of LHC data.**
 - $\text{BR}(H \rightarrow bb) = 57.8\%$
- There are three decay modes depending on the W decay:
 - $ttH \rightarrow 4 \text{ jet} + 2 \text{ lepton mode}$: $\text{BR}(tt \rightarrow blvblv) = 11\%$ -- not analyzed
 - **$ttH \rightarrow 6 \text{ jet} + \text{lepton mode}$** : $\text{BR}(tt \rightarrow bqqblv) = 45\%$ for $l=e, \mu, \tau$ (29% for $l=e, \mu$)
 - **$ttH \rightarrow 8 \text{ jet mode}$** : $\text{BR}(tt \rightarrow bqqbqq) = 44\%$

Signal samples

Weights are calculated assuming data samples of:

- 0.5 ab^{-1} for $(-0.8, +0.2)$
- 0.5 ab^{-1} for $(+0.8, -0.2)$

which are summed.

All weights $\ll 1$:

→ We have sufficient statistics.

- Start with standard reconstruction samples for DBD
- Removal of $\gamma\gamma \rightarrow$ hadrons pileup background
- Isolated lepton selection
- Event selection based on
 - b-tagging, jet combination mass, etc
- Comparison of two analyses:
 - Cut-based
 - TMVA-based with Boosted Decision Trees

Average 4.1 events $\gamma\gamma \rightarrow \text{hadrons}$ are overlaid in all simulations.

→ Degrade the mass resolution due to extra energy in the forward region.

Black (dotted):

Durham (sample w/o $\gamma\gamma \rightarrow \text{hadrons}$)

Red:

Durham (sample w/ $\gamma\gamma \rightarrow \text{hadrons}$)

Blue:

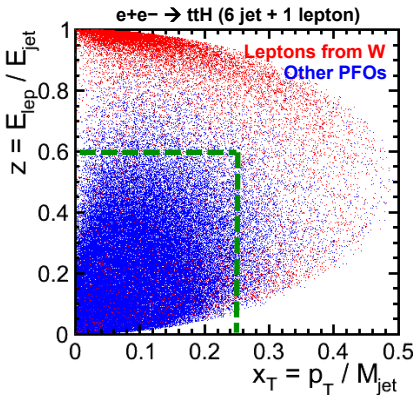

Durham (sample w/ $\gamma\gamma \rightarrow \text{hadrons}$)
after removing $\cos\theta > 0.94$ particles

→ **Mass resolution can be recovered.**

(PFOs are mostly central for $t\bar{t}H$ process.)

kt algorithm with $R=1.2$ is actually used for consistency with 6 jet + lepton analysis (studied by Tony Price)

Hard isolated leptons coming from W decay

- Useful for separating 6 jet + lepton / 8 jet / background

Selection criteria based on:

- **Lepton ID with calorimeter energies** which reduces fake leptons
- **Impact parameter significance** for reducing contamination from bottom and tau decays
- **Jet-based isolation** (“LAL Lepton Finder”)
 - isolated lepton in jets tends to be “leading” or have “large p_T w.r.t jet axis”

	Efficiency	Composition			
		$W \rightarrow e, \mu$	$W \rightarrow \tau \rightarrow e, \mu$	Other e, μ	Fake e, μ
Electrons	84.0%	94.2%	2.9%	1.6%	2.3%
Muons	90.5%	96.3%	2.4%	1.2%	0.7%

Performance of isolated lepton finder for $t\bar{t}H$ 6 jets + 1 lepton sample

Cut-based analysis result (8 jet mode only):
 Statistical significance = 7.2 sigma

- Use TMVA Boosted Decision Trees with Gradient boost
- 18 variables (shown earlier) were used

Cut efficiencies and optimal cut value

TMVA analysis result (8 jet mode only):
Statistical significance = 9.6 sigma

Error in normalization of the events was found and fixed.

Correlation Matrix (signal)

Correlation Matrix (background)

Difference between cut-based and TMVA-based analysis will be studied.
The input variables are correlated.

So far our results give the statistical precision only.

For $\mathbf{O(1)\%}$ measurements, need to address **systematic uncertainties** such as:

- Background normalization
- Jet energy scale
- Luminosity spectrum
- B-tagging efficiency
- Lepton isolation criteria
- Lepton ID performance
- ...

→ *These are the next steps...*

- Hadronic (“8 jet”) analysis:
 - Cut-based analysis: 7.2 sigma
 - TMVA-based analysis: 9.6 sigma
- Semileptonic (“6 jet”) analysis (**Tony Price**):
 - Cut-based analysis: 5.4 sigma
 - TMVA-based analysis: 7.6 sigma
- **Combined: 12.2 sigma, 4.3% precision in $\Delta y_t/y_t$ (TMVA)**
 - for 0.5 ab^{-1} (-0.8, +0.2) and 0.5 ab^{-1} (+0.8, -0.2)
- To-do:
 - Include final results into DBD
 - Combine ILD + SiD works into publication
 - Consideration of systematic uncertainties
