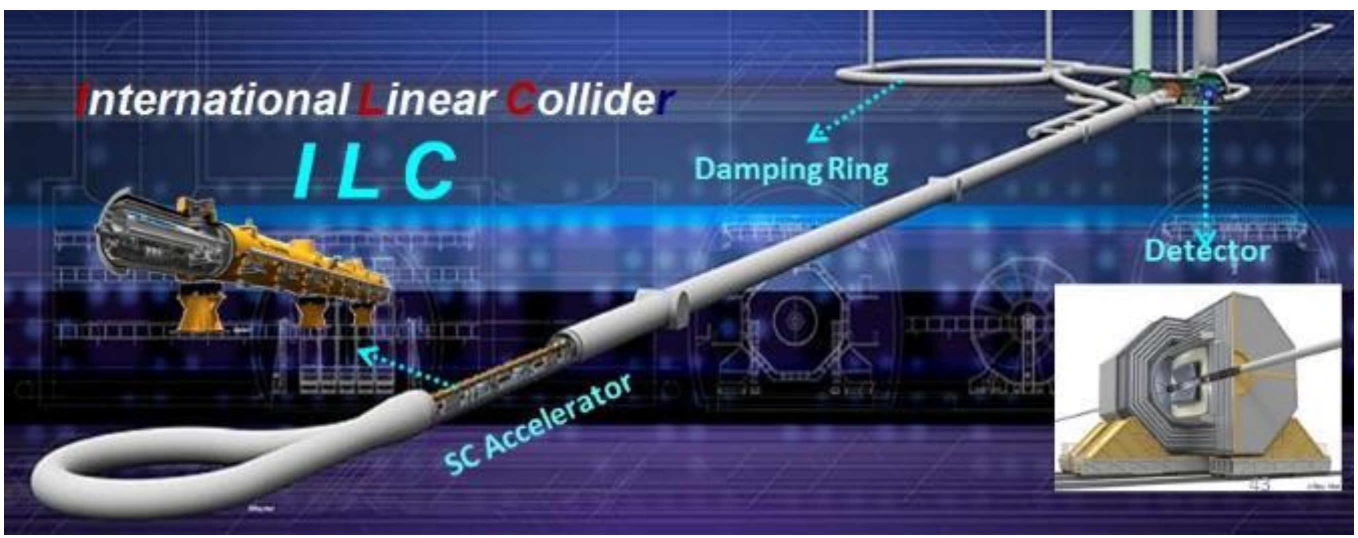
Improve Efficiency of Power Consumption in Accelerator Operation

Green ILC

serious issue for ILC



2nd Workshop
Energy for Sustainable Science
at Research Infrastructures

CERN, GENEVA, SWITZERLAND, 23-25 OCTOBER 2013

Energy Management in Japan, Consequences for Research Infrastructures

Masakazu Yoshioka (KEK)

1. Electric power supply in Japan, before and after March 11, 2011 earthquake
   - High efficiency and "almost" environmental pollution-free electricity generators can save Japan, and contribute to reduce global CO_2 problem
2. KEK Electricity contract as an example of large-scale RIs
3. Accelerator design by considering optimization of luminosity/electricity demand
   - Example: Super-KEKB
   - ILC
4. Accelerator component design by considering high power-efficiency
   - Klystron
   - Availability based on MTBF and MTTR
5. Summary

ILC: an amazing energy transformer

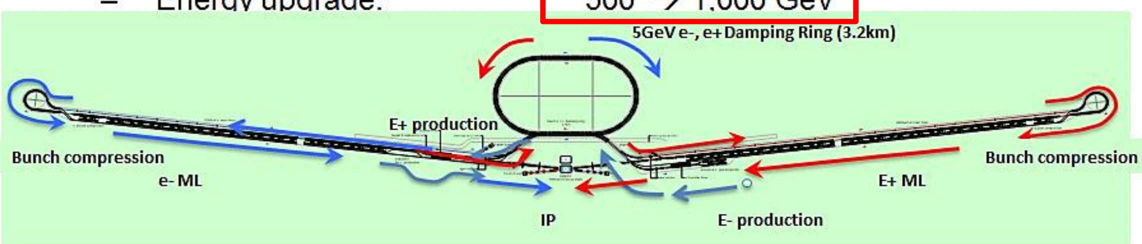
Power Balance of Consumption and Loss in ILC

Requirements from Physics Exp.

- Basic requirements :
  - Luminosity : $\int Ldt$ = 500 fb^{-1} in 4 years
  - E_{cm} : 200 – 500 GeV and the ability to scan
  - E stability and precision: < 0.1%
  - Electron polarization: > 80%
- Extension capability :
  - Energy upgrade: 500 → 1,000 GeV



ILC 500 GeV Total Power : ～200 MW

Improve efficiency

loss rate

Infrastructure : 50 MW	**50 % : 25 MW**
RF System : 70 MW	**50 % : 35 MW**
Cryogenics : 70 MW	**90 % : 60 MW**
Beam Dump : 10 MW	**100 % : 10 MW**
200 MW	**～ 130 MW**

Obligation to Us

Increase recovery

Activities for Green ILC

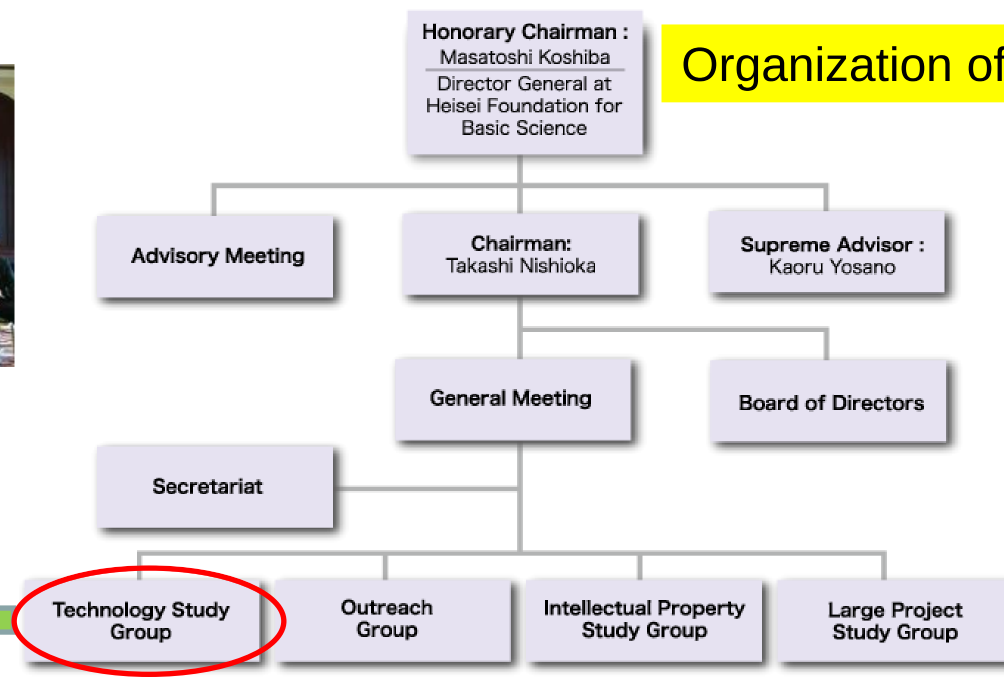
- Three presentations were given (by A. Suzuki, D. Perret-Gallix, and M. Yoshioka) in 2nd WS "Energy for Sustainable Science at Research Infrastructure" at CERN in Oct. 2013.
- A session (four presentations) was organized for Green-ILC activities in LCWS 2013 at Tokyo in Nov. 2013. A. Suzuki also presented Green-ILC activities in the plenary session in LCWS 2013.
- Green-ILC Working Group was organized in "Advanced Accelerator Association promoting science & technology (AAA) in Tokyo/Japan. The 1st meeting for the Green-ILC WG of AAA was held on 25th February 2014. (AAA home page = https://aaa-sentan.org/en/about_us.html)
- 2nd Green-ILC WG meeting was held on 5th May 2014 in Tokyo/Japan. Some realistic technologies of energy-saving for ILC were proposed and discussed by industries and scientists.
- D. Perret-Gallix is preparing the interactive home page of Green-ILC and is going to launch it soon.

Advanced Accelerator Association promoting science & technology (AAA)

Association by industries and scientists

- 96 corporate organizations involved from industries（MHI, Toshiba, Hitachi, Mitsubishi Electronics, etc.) as of May 2014.
- 40 institutional organizations involved from universities and laboratories（KEK、Univ. of Tokyo、Univ. of Tohoku, Univ. of Kyoto, Riken, etc.) as of May 2014.

Organization of AAA



Green-ILC WG started in Technology Study Group on 25th Feb. 2014.

Agenda for the 2nd AAA Green-ILC WG meeting

Date: 8th May 2014 (Thu.) 13:30 - 17:00.
Place: 6th floor, UDX Building in Akihabara, Tokyo.

1) **Collector Potential Depression (CPI) Klystron (30 min.)**
by Toshiba Electron Tubes & Devices Co. Ltd.

2) **Power Saving of Large-Scaled Helium Compressor (30 min.)**
by Mayekawa Manufacturing Company.

3) **Examples of New Energy Power Plants (20 min.)**
by RIKEN.

4) **Solar Power Plant (40 min.)**
by Japan Photovoltaic Energy Association

5) **Proposal of Biomass Power Plant for ILC (20 min.)**
by Kabuki Construction Co. Ltd.

Agenda for the 2nd AAA Green-ILC WG meeting

Date: 8th May 2014 (Thu.) 13:30 - 17:00.
Place: 6^{th} floor, UDX Building in Akihabara, Tokyo.

1) Collector Potential Depression (CPI) Klystron (30 min.)
by Toshiba Electron Tubes & Devices Co. Ltd.

2) Power Saving of Large-Scaled Helium Compressor (30 min.)
by Mayekawa Manufacturing Company.

3) Examples of New Energy Power Plants (20 min.)
by RIKEN.

4) Solar Power Plant (40 min.)
by Japan Photovoltaic Energy Association

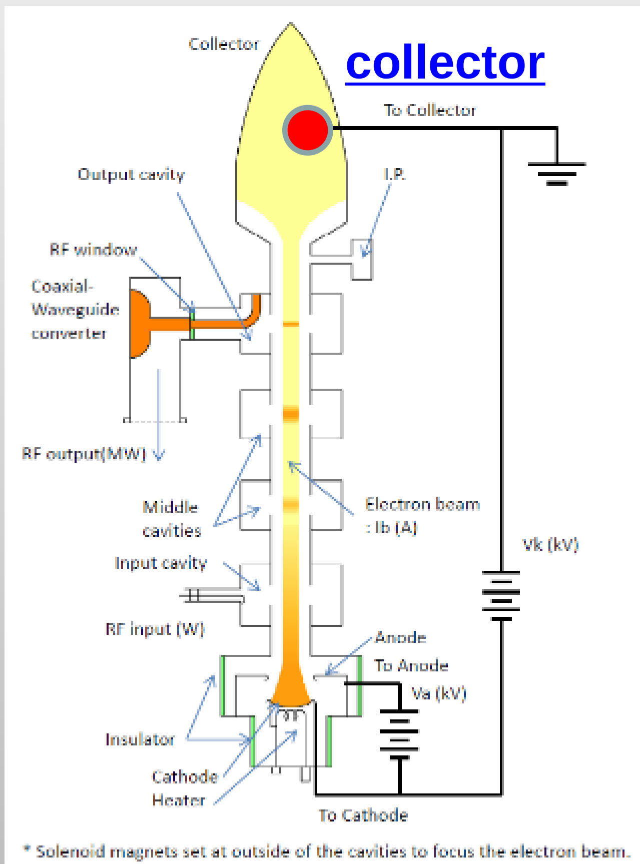
5) Proposal of Biomass Power Plant for ILC (20 min.)
by Kabuki Construction Co. Ltd.

How to Improve RF Efficiency

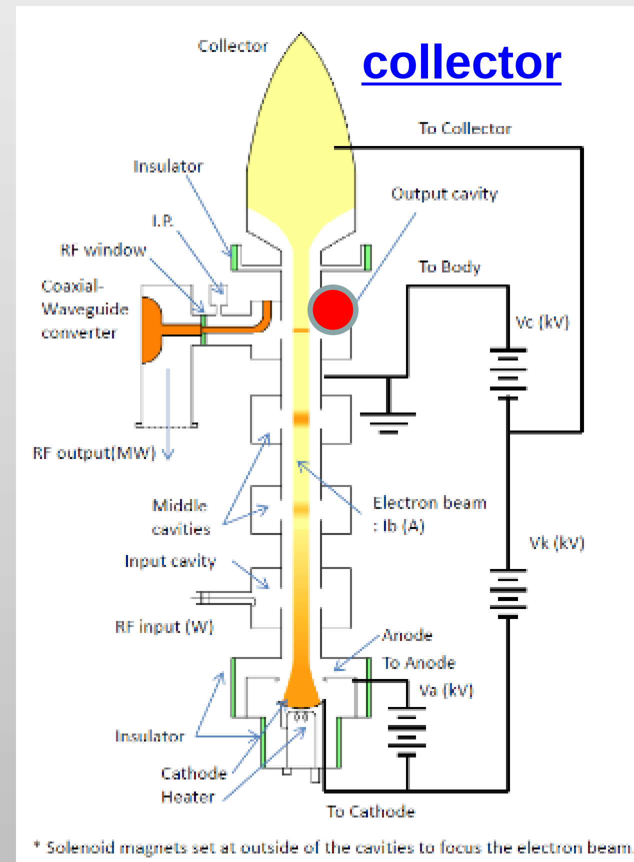
R&D of CPD (Collector Potential Depression) Klystron

CPD is an energy-saving scheme that recovers the kinetic energy of the spent electrons after generating rf power.

Conventional



Schematic diagram of CPD

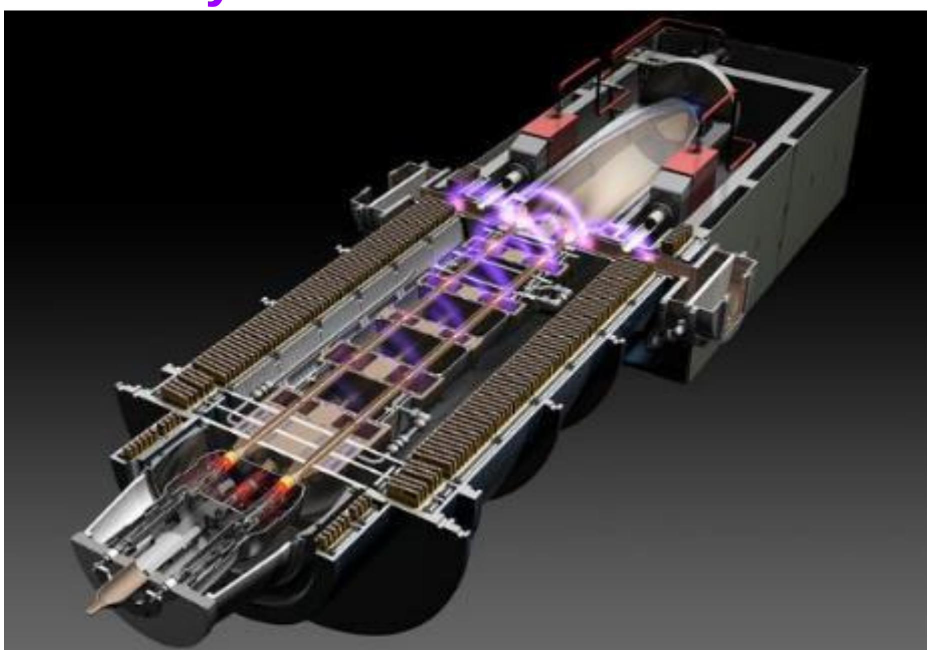


Multi(6) – Beam Klystron (MBK) for 26 Cavities for ILC

DEVELOPMENT OF TOSHIBA L-BAND MULTI-BEAM KLYSTRON FOR EUROPEAN XFEL PROJECT

Y. H. Chin, KEK, Tsukuba, Japan,
A.Yano, S. Miyake, TOSHIBA ELCTRON TUBES & DEVICES Co., Ltd., Ohtawa-shi, Japan,
S. Choroba, DESY, Hamburg, Germany

- **The design goal is to achieve 10 MW peak power with 65 % efficiency at 1.5 ms pulse length at 10 Hz repetition rates.**
- **MBK has 6 low-perveance beams operated at low voltage of 115 kV for 10 MW to enable a higher efficiency than a single-beam klystron.**



e 2: Electron Gun of the E3736.

Frequency	1.3 GHz
Peak power	10 MW
Pulse width	1.6 ms
Rep. rate	5 Hz
Average power	78 kW
Efficiency	**65 %**
Gain	47dB
BW (- 1dB)	3 MHz
Voltage	120 kV
Current	140 A
Lifetime	40,000 h

Present Status of R&D

Target

proof-of-principle of CPD in the unsaturated region (a maximum rf power of 500 kW) using a KEKB 1.2MW-klystron

Newly fabricated components
- collector
- ceramic insulator
- output cavity
- output coupler

Recycled components
- electron gun
- input cavity
- intemediate cavities

R&D Schedule

2013.3: Modification of an existing klystron to CPD klystron (already done)

2014.3: until then, preparation and commissioning of the test station

~2014: Verification of klystron operation without CPD

~2015: Measurement of rf leakage from the gap between the body column and the collector (with no CPD voltage applied)

Measurement of induced pulse voltage on the collector with CPD

~2017: Test of rectification by Marx circuit

Integration test of the proof-of-principle of CPD operation

Goal : 80 % efficiency

Agenda for the 2nd AAA Green-ILC WG meeting

Date: 8th May 2014 (Thu.) 13:30 - 17:00.
Place: 6th floor, UDX Building in Akihabara, Tokyo.

1) Collector Potential Depression (CPI) Klystron (30 min.)
by Toshiba Electron Tubes & Devices Co. Ltd.

2) Power Saving of Large-Scaled Helium Compressor (30 min.)
by Mayekawa Manufacturing Company.

3) Examples of New Energy Power Plants (20 min.)
by RIKEN.

4) Solar Power Plant (40 min.)
by Japan Photovoltaic Energy Association

5) Proposal of Biomass Power Plant for ILC (20 min.)
by Kabuki Construction Co. Ltd.

Estimate of Electric Power

Assuming the efficiency of 10～20%

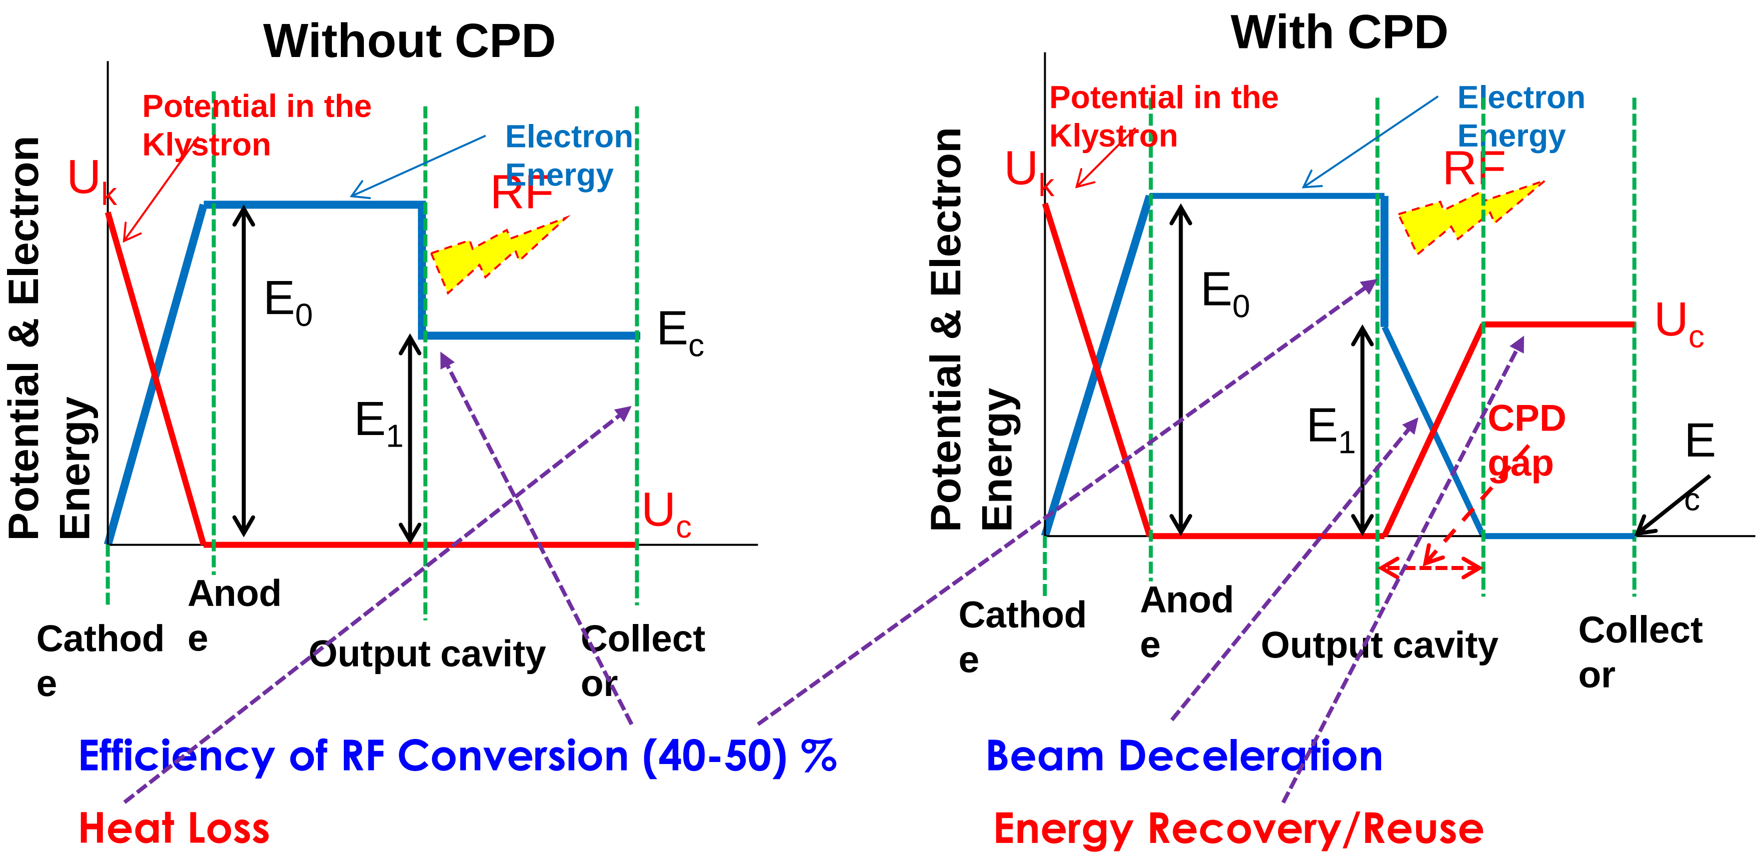
Kitakami Site	58,104 kW×10 ～20% = 6,000～10,000kW
Sefuri Site	43,280 kW×10 ～20% = 5,000～10,000kW

Summary

- The 1st meeting for the Green-ILC WG of AAA was held on 25th February 2014 to launch the Green-ILC activity.
- The 2nd Green-ILC WG meeting was held on 5th May 2014 in Tokyo/Japan. Some realistic technologies of energy-saving for ILC were proposed and discussed by industries and scientists.
  1) Collector Potential Depression (CPI) Klystron (30 min.)
     by Toshiba Electron Tubes & Devices Co. Ltd.
  2) Power Saving of Large-Scaled Helium Compressor (30 min.)
     by Mayekawa Manufacturing Company.
  3) Examples of New Energy Power Plants (20 min.)
     by RIKEN.
  4) Solar Power Plant (40 min.)
     by Japan Photovoltaic Energy Association
  5) Proposal of Biomass Power Plant for ILC (20 min.)
     by Kabuki Construction Co. Ltd.
- Proposed items for energy-saving for ILC might be summarized and written in the report under the framework of AAA.

Backup slides

Simplified Schematic Concept

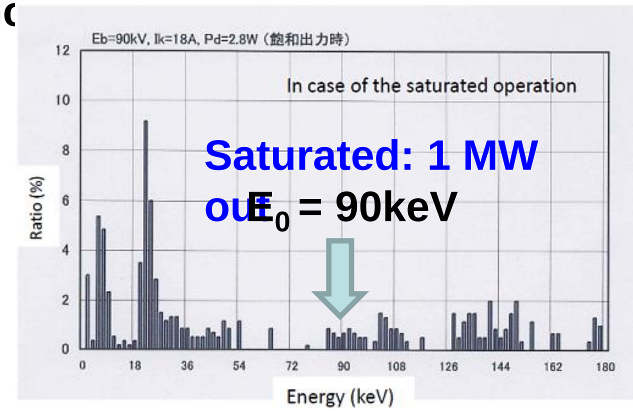


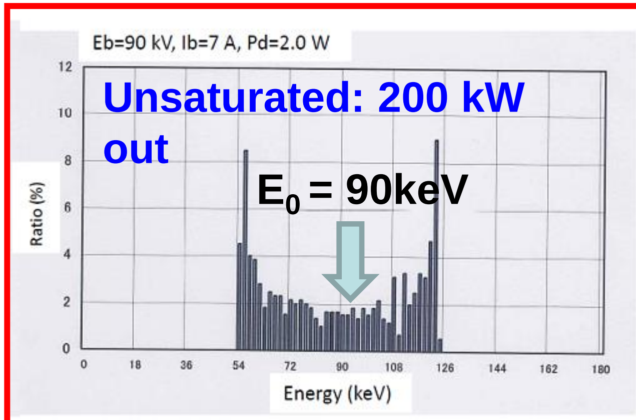
Potential denotes the electron potential energy, eV. For simplicity, input and intermediate cavities are omitted here and the anode potential is set to zero.

Issues must be addressed for CPD Klystron

(I) Energy spread

The spent electron beam has **large energy spread** through electromagnetic interaction in the cavities. Therefore, **the collector potential cannot be increased beyond the lower limit of energy distribution** of the spent electron beam, otherwise backward electrons hit the cavities or the gun, and then deteriorate the klystron performanc





(II) Pulse-to-DC conversion

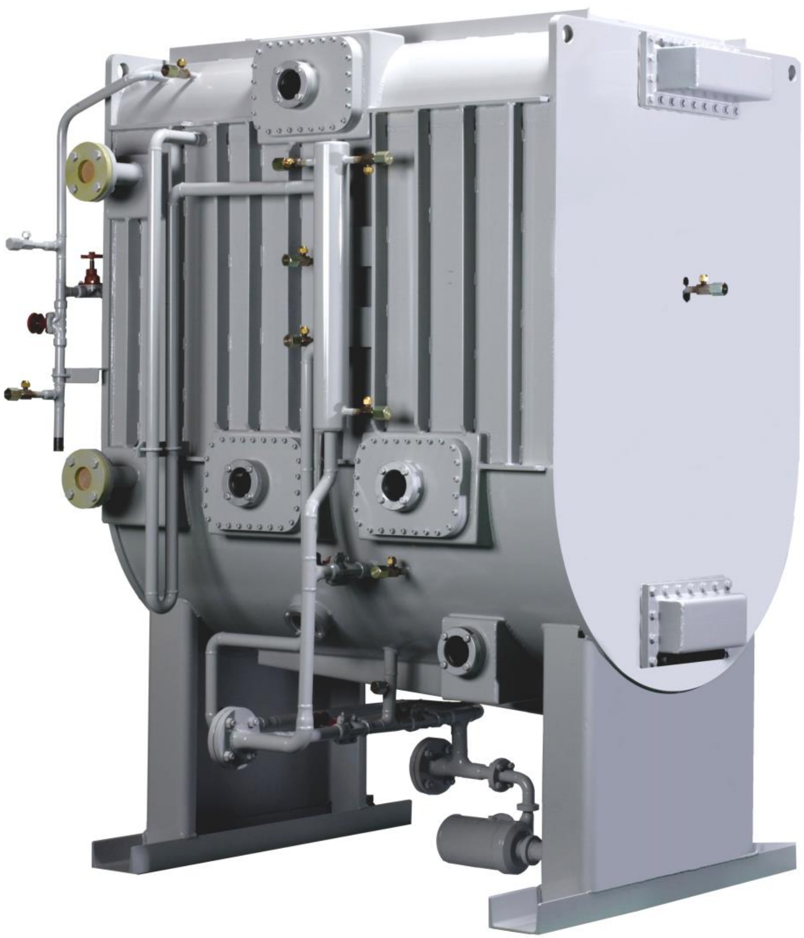
The spent electron beam is longitudinally bunched, so that **pulsed voltage is induced on the collector**. An **adequate pulse-to-DC converter** has to be implemented.

(III) RF Leakage

CPD klystron has to be equipped with an **insulator between the collector and the body column** in order to apply CPD voltage to the collector. Thus, it would be possible for the CPD klystron to **leak rf power** out more or less from the insulator.

MAYEKAWA

Adsorption chiller "AdRef"



Environmentally Friendly Chiller.

Features

1. No CFCs, HCFCs used.

   Water (H2O) is used as refrigerant.

2. Low temperature heat source.

   As low as 65 C

3. Super Energy Saving

   Only a few HP necessary

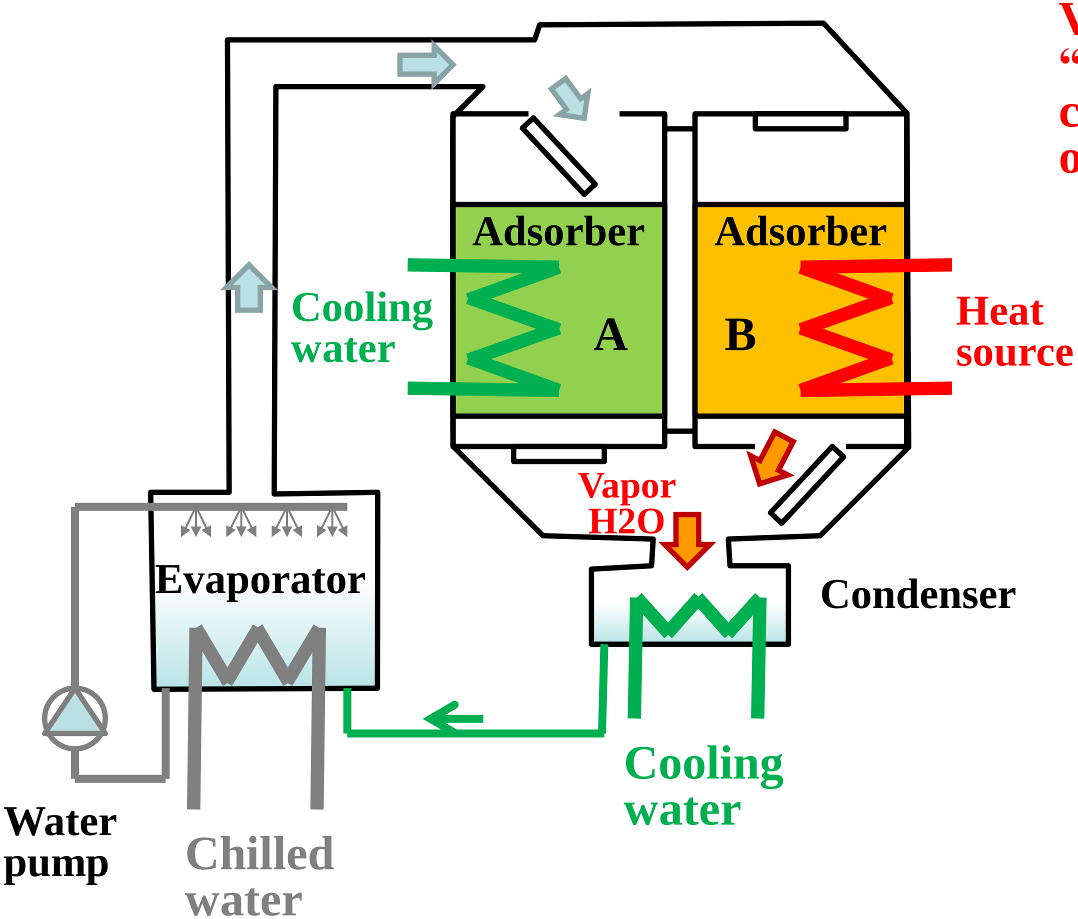
4. Easy maintenance

   Very few moving parts used.

5. Safe

   No pressure piping or refrigerant

Adsorption chiller "AdRef"



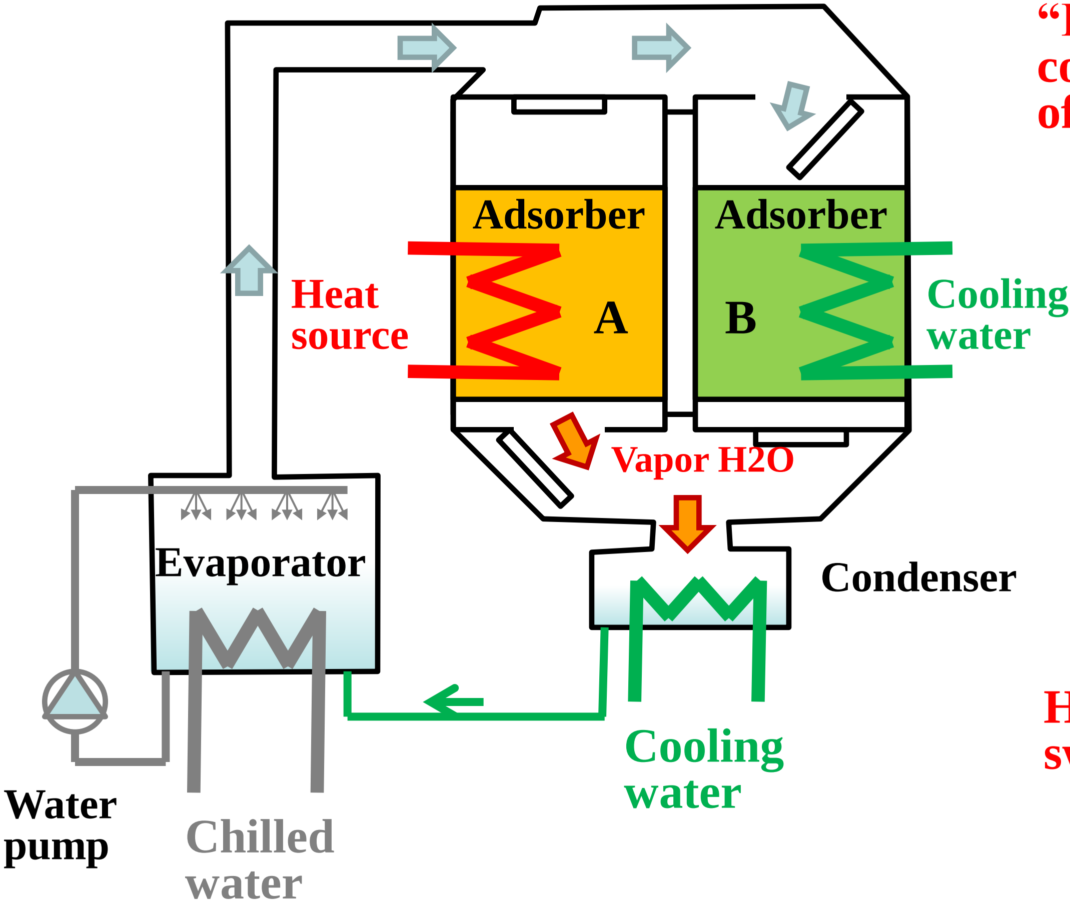
Vapor H2O is removed from adsorber "B" by heating with warm water, and condensed in the condenser by the cool of cooling water.

Liquid water goes to the evaporator.

The adsorber "A" adsorb vapor H2O by cool of cooling water.

Then the liquid H2O in the evaporator evaporates, and the latent heat cool down the chilled water.

Adsorption chiller "AdRef"



Vapor H_2O is removed from adsorber "B" by heating with warm water, and condensed in the condenser by the cool of cooling water.

Liquid water goes to the evaporator.

The adsorber "A" adsorb vapor H_2O by cool of cooling water.

Then the liquid H_2O in the evaporator evaporates, and the latent heat cool down the chilled water.

Heating/Cooling of adsorber A/B is switched periodically.

Absorption refrigerator (chiller) (from Wikipedia, the free encyclopedia)

- An **absorption refrigerator** is a refrigerator that uses a heat source (e.g., solar, kerosene-fueled flame, waste heat from factories or district heating systems) to provide the energy needed to drive the cooling system.
- In the early years of the twentieth century, the vapor absorption cycle using water-ammonia systems was popular and widely used, but after the development of the vapor compression cycle it lost much of its importance because of its low coefficient of performance (about one fifth of that of the vapor compression cycle). Nowadays, the vapor absorption cycle is used only where waste heat is available or where heat is derived from solar collectors. Absorption refrigerators are a popular alternative to regular compressor refrigerators where electricity is unreliable, costly, or unavailable, where noise from the compressor is problematic, or where surplus heat is available (e.g., from turbine exhausts or industrial processes, or from solar plants).
