

Recoil mass analysis to prove performance not to be difference between SiECAL and ScECAL

June, 6, 2014

T. Ogawa

Today's report :

➔ Lepton channel at 350GeV with all cut base analysis.

My Motivation

- My motivation is to compare performance between SiECAL and ScECAL

- JER is slightly difference, $\sim 0.3\%$
but actually how about for physics analysis?

- For my fist test,
I want to confirm whether the difference appear or not
by using recoil mass analysis ($\mu\mu$, ee , qq)

$\mu\mu$ \rightarrow This does not depend on ECAL.

ee \rightarrow This also does not depend on ECAL.

qq \rightarrow This also does not depend on ECAL, I hope...

Nobody confirm these response, I try it.

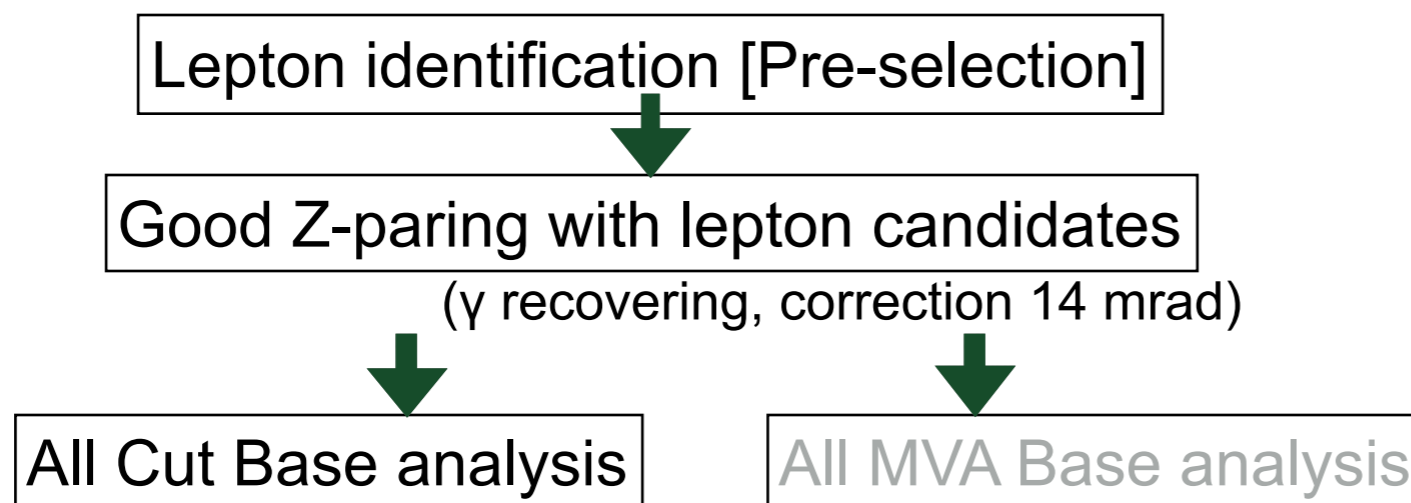

Simulation condition & Analysis flow

- Analysis channel is $\mu\mu$, ee , qq .
- \sqrt{s} is 350GeV($L=350\text{fb}^{-1}$), 250GeV($L=250\text{fb}^{-1}$), 500GeV($L=500\text{fb}^{-1}$).
Beam polarization is (-0.8, +0.3)
- Signal is full simulated by using SiECAL and ScECAL.
- For now, I used BG reconstructed with SiECAL (DST sample).

In case the difference does not appear for signal,
it is expected that there is not difference against BG.

- Analysis flow is:

Lepton identification [Pre-selection]

- Decide cut parameters from simulation of single particle injection.

Refer response of ECAL, HCAL, MUCAL, and P.

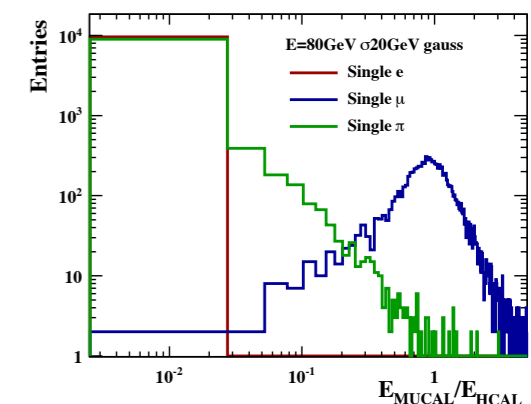

$track_P > 12\text{GeV}$	e-ID	μ -ID
$hcal_E / allcal_E$	< 0.95	< 0.95
$ecal_E / hcal_E$	$3 <$	< 8
$mucal_E / hcal_E$	< 0.03	$0.05 <$
$ecal_E / allcal_E$	$0.85 <$	< 0.5
$allcal_E \text{ div } track_P$	$0.7 <, < 1.25$	< 0.5

- For 350GeV eeH/mmH signal events.

Si	e-ID	μ -ID
TRUE	50807	51987
id	50032	52346
true&&id	49409	51917
purity	97.25	99.87
efficiency	98.75	99.18

Sc w/ssa	e-ID	μ -ID
TRUE	50117	52337
id	49822	52027
true&&id	48691	51950
purity	97.73	99.85
efficiency	97.15	99.26

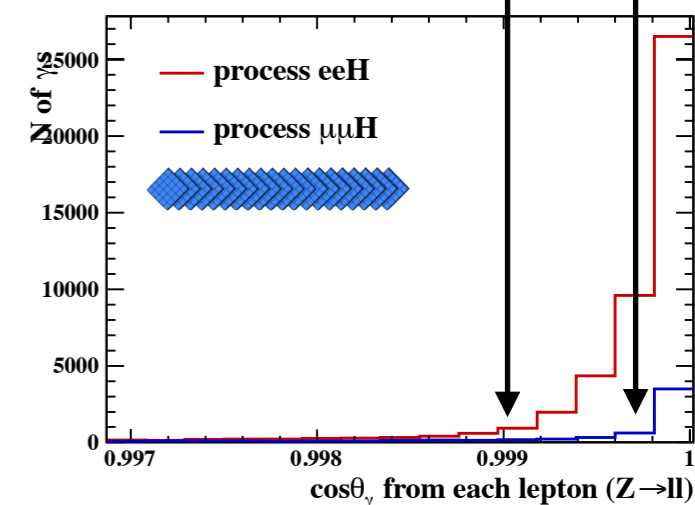

- Efficiency and purity are almost same.

Gamma recovery [FSR, Bremstahlung]

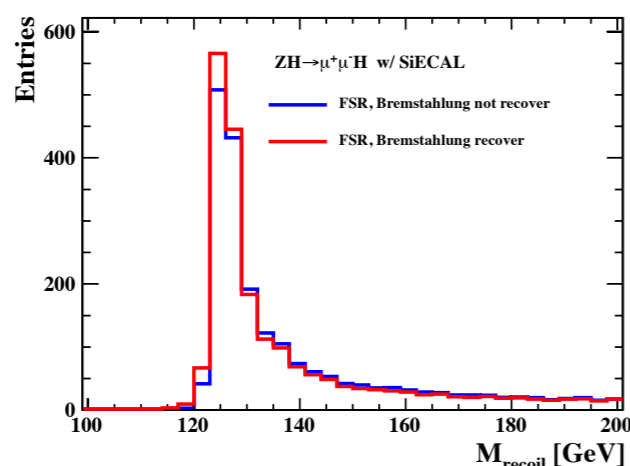

- After lepton identification, select the best lepton pair closest to Z mass.
- Apply gamma recovery.
 - $\cos\theta$ between lepton and gamma > 0.9997

0.9997

0.999

mmH

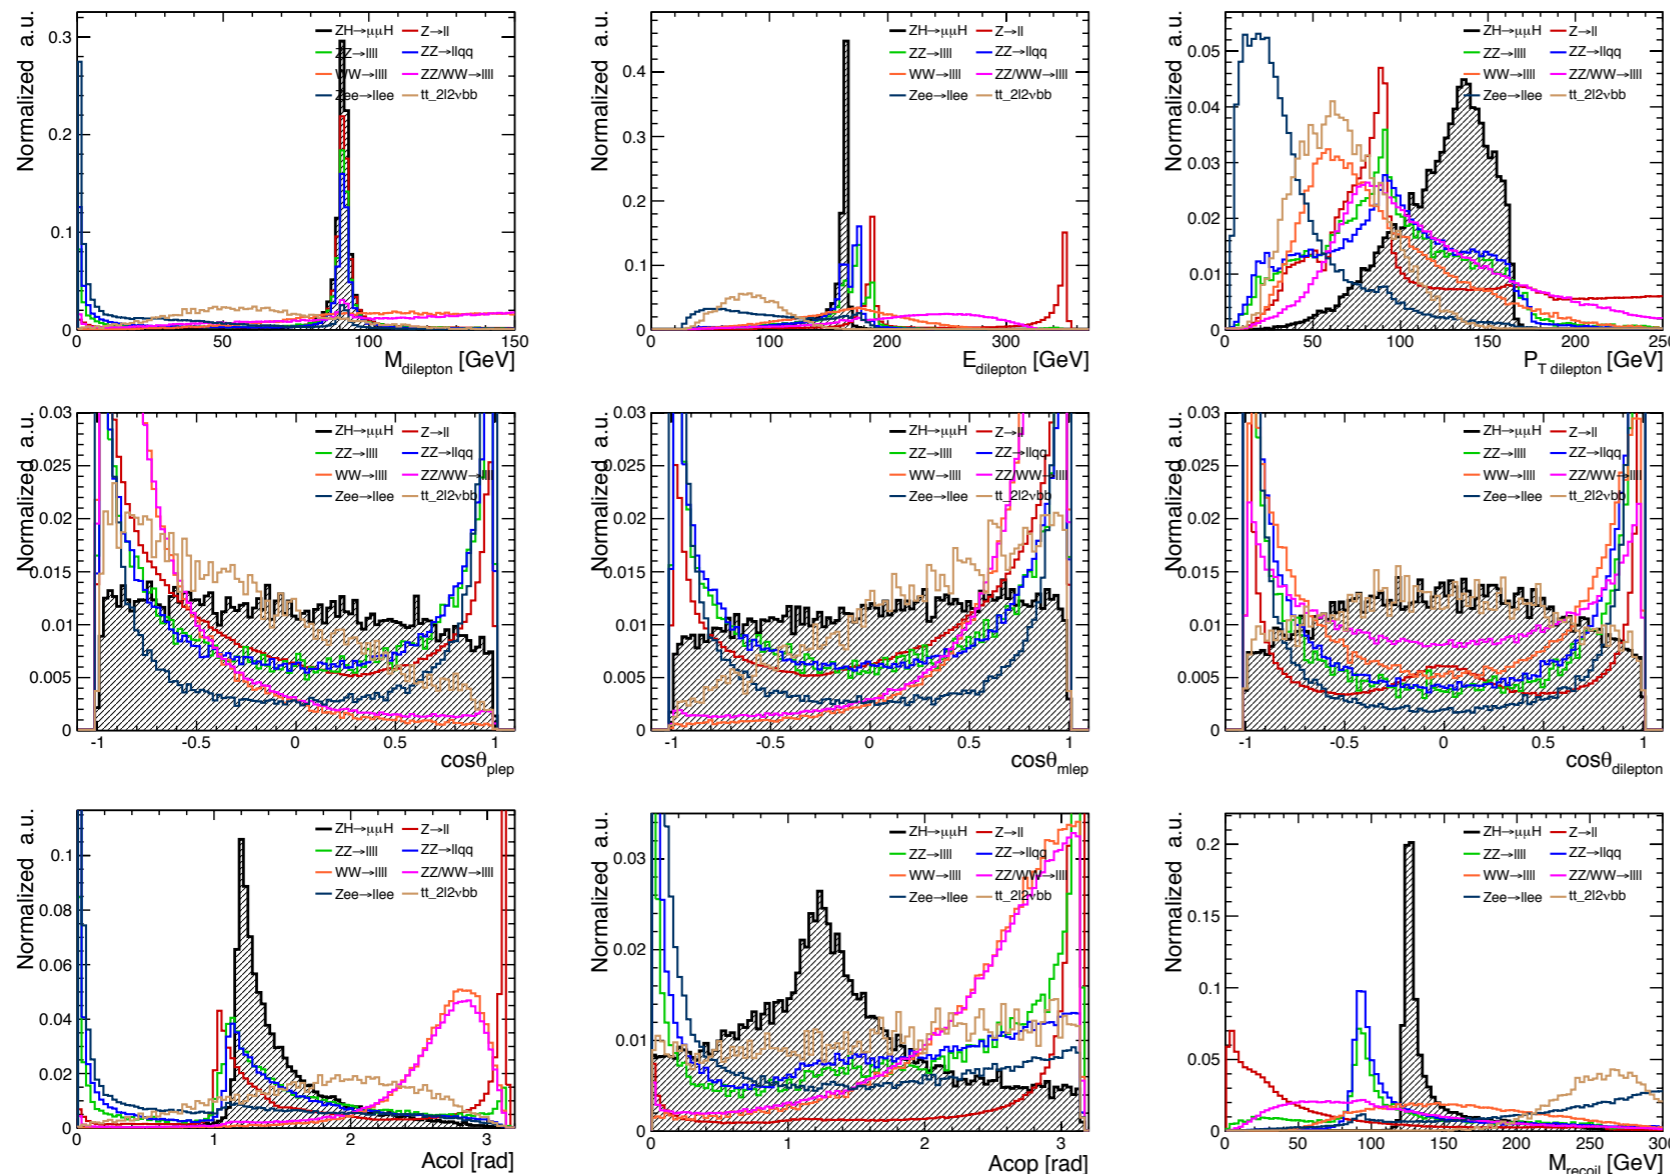

eeH

BG suppression

- With reference to a lower physical variables, applied BG suppression.
Same cut value is applied to both eeh and mmh channels, also SiECAL and ScECAL

Range of rejection

- $\cos\theta_m < -0.85$
- $\cos\theta_p > 0.85$
- $p_{T,dilep} < 60 \parallel 165 < p_{T,dilep}$
- $z_{mass} < 84 \parallel 98 < z_{mass}$
- $acoplanarity < 0.2 \parallel 2.9 < acoplanarity$
- $acollinearity < 1.15 \parallel 2.5 < acollinearity$
- $abs(\cos\theta_Z) > 0.85$
- $z_{energy} < 150 \parallel 168 < z_{energy}$
- $recoil < 115 \parallel 145 < recoil$

Not consider these variables yet

$|\cos\theta_{missing}|, \delta P_{T,bal}, \dots$

Reduction table [Si and Sc]

ZH \rightarrow qqH @ 250GeV, 350GeV, 500GeV (-0.8, +0.3)

Summary of Cross Section (-0.8, +0.3)

- For 250GeV (250fb⁻¹)

[E250_e1L0_8_E1R0_3_zh_qqh]
xsec = 212.234
xsec*lumi = 53058.5

[4f_WW_semileptonic]
xsec = 10992.9
xsec*lumi = 2.74823e+06

[4f_ZZ_semileptonic]
xsec = 856.927
xsec*lumi = 214232

[4f_ZZ_hadronic]
xsec = 841.376
xsec*lumi = 210344

[4f_WW_hadronic]
xsec = 8706.23
xsec*lumi = 2.17656e+06

[4f_singleZee_semileptonic]
xsec = 279.625
xsec*lumi = 69906.3

- For 350GeV (350fb⁻¹)

[E350_e1L0_8_E1R0_3_zh_qqh]
xsec = 142.646
xsec*lumi = 49926

[4f_WW_semileptonic]
xsec = 8155.94
xsec*lumi = 2.85458e+06

[4f_ZZ_semileptonic]
xsec = 564.825
xsec*lumi = 197689

[4f_ZZ_hadronic]
xsec = 600.841
xsec*lumi = 210294

[4f_WW_hadronic]
xsec = 6532.83
xsec*lumi = 2.28649e+06

[4f_singleZee_semileptonic]
xsec = 309.998
xsec*lumi = 108499

[tt-ln4q]
xsec = 76.2609
xsec*lumi = 26691.3

- For 500GeV (500fb⁻¹)

Analysis flow [Follow M.Thomson flow]

- Basically I follow M.Thomson analysis.

- Force jet-clustering into 3-Jets , 4-Jets and 5-Jets with Durham algorithm at each event.

3-Jet : select the best pair closest to W mass

4-Jet : select the best two pairs closest to Z mass & W mass

5-Jet : select the best two pairs closest to Z mass & W mass

- Default is to treat as 4-jets

5-jet reconstruction gives

“better” Z mass and “better” Higgs recoil mass

➔ treat as 5-jets

- Then, target cut for BG suppression.

Visible and Invisible Higgs Decays at 350 GeV
Mark Thomson & Kelvin Mei
University of Cambridge

The diagram shows an electron-positron annihilation process producing a Z boson and a Higgs boson. Below this, a photograph of Mark Thomson is shown next to a stylized Higgs boson icon, with an equals sign between them.

Now treat as $ZH \rightarrow qq X$

4, 5, or 6 jets?

- ★ Find that it rarely helps going from 5 → 6: even if a 6-jet final state, provided reconstruct two “hard” jets from Z decay OK

So choose between 4 or 5 jet topology:

- ★ Default is to treat as 4-jets
- ★ Reconstruct as 5-jets only if:
 - $-\log_{10}(y_{45}) < 3.5$ AND
 - 5-jet reconstruction gives “better” Z mass and “better” Higgs recoil mass

“better” = closer to true masses

Mark Thomson Fermilab, May 2014 17

A simple plan

First... Kill background with targeted cuts (as far as possible)

- ★ Main backgrounds are large cross section processes:
 - ZZ
 - WW
 - qq

In each case reconstruct event assuming it is the background – then use invariant mass...

Mark Thomson LCWS13, Tokyo 21

Target cut for BG suppression

- For 250GeV (250fb⁻¹) (-0.8, +0.3)

ZZ → qqqq

ZH → qqxx

WW → qqqq

ZH → qqxx

WW → qqlv

Other cuts

- visE < 260
- |cosθ_{jet1}| < 0.95
- |cosθ_{jet2}| < 0.95
- 0.8 < |cosθ_{jet12}| < 0.0
- |cosθ_Z| < 0.75
- Pt²_{jet1} > 1200
- 90 < E_z < 130
- 85 < M_z < 105

Target cut for BG suppression

- For 350GeV (350fb⁻¹) (-0.8, +0.3)

ZZ → qqqq

ZH → qqxx

WW → qqqq

ZH → qqxx

WW → qqlv

Other cuts

- visE < 360
- |cosθjet1| < 0.9
- |cosθjet2| < 0.9
- 0.8 < |cosθjet12| < 0.5
- |cosθZ| < 0.7
- Pt²_jet1 > 2500
- 100 < E_z < 180
- 85 < M_z < 105

Target cut for BG suppression

- For 500GeV (500fb⁻¹) (-0.8, +0.3)

ZZ → qqqq

ZH → qqxx

WW → qqqq

ZH → qqxx

WW → qqlv

Other cuts

- $\text{visE} < 510$
- $|\cos\theta_{\text{jet1}}| < 0.75$
- $|\cos\theta_{\text{jet2}}| < 0.75$
- $-0.6 < |\cos\theta_{\text{jet12}}| < 0.78$
- $|\cos\theta_Z| < 0.7$
- $Pt^2_{\text{jet1}} > 2500$
- $100 < E_z < 255$
- $85 < M_z < 105$

Process ZH -> qqH @ 250 GeV (-0.8, +0.3)

For now, I can not observe remarkable difference between SiECAL and ScECAL.

**But,
Each cut have not optimized yet.
MI does not keep same efficiency.
Need to try more detailed analysis.
And also apply MVA method.**
