

# Quick look at cosmics with Micromegas

LPTPC Analysis meeting #22 - 22.07.14

C. Kleinwort - DESY

# Introduction

- ★ Quick look at *Micromegas* run 04097 (2014)
  - ▶ 7 modules
  - ▶ *Cosmics* (mainly) parallel to pad rows
  - ▶ 1000 events analysed

# Reconstruction

- ★ Standard MM reconstruction up to hit level
  - ▶ Thanks to P. Hayman
- ★ Track finding with FastHough Transformation
  - ▶ Track parametrisation  $X(Y), Z(Y)$
  - ▶ Hits rotated by  $90^\circ$  in software
    - ◆  $X \leftrightarrow Y, \text{ rows} \leftrightarrow \text{ pads}$
- ★ Track fitting
  - ▶ with 'radial' direction as measurement direction
    - ◆ expected resolution: row distance /  $\sqrt{12} \approx 2 \text{ mm}$

# Example track (I)

\* hits on track

# Example track (II)

\* hits on track

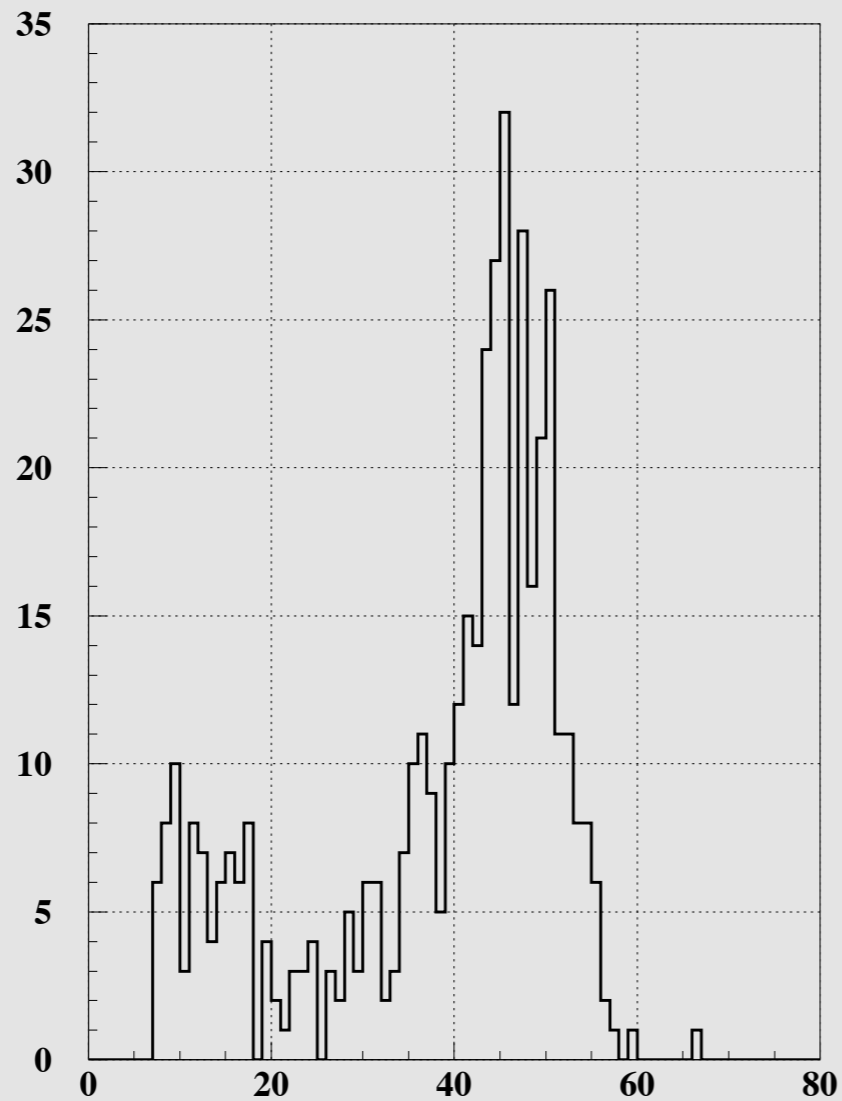

# Example track (III)

\* hits on track

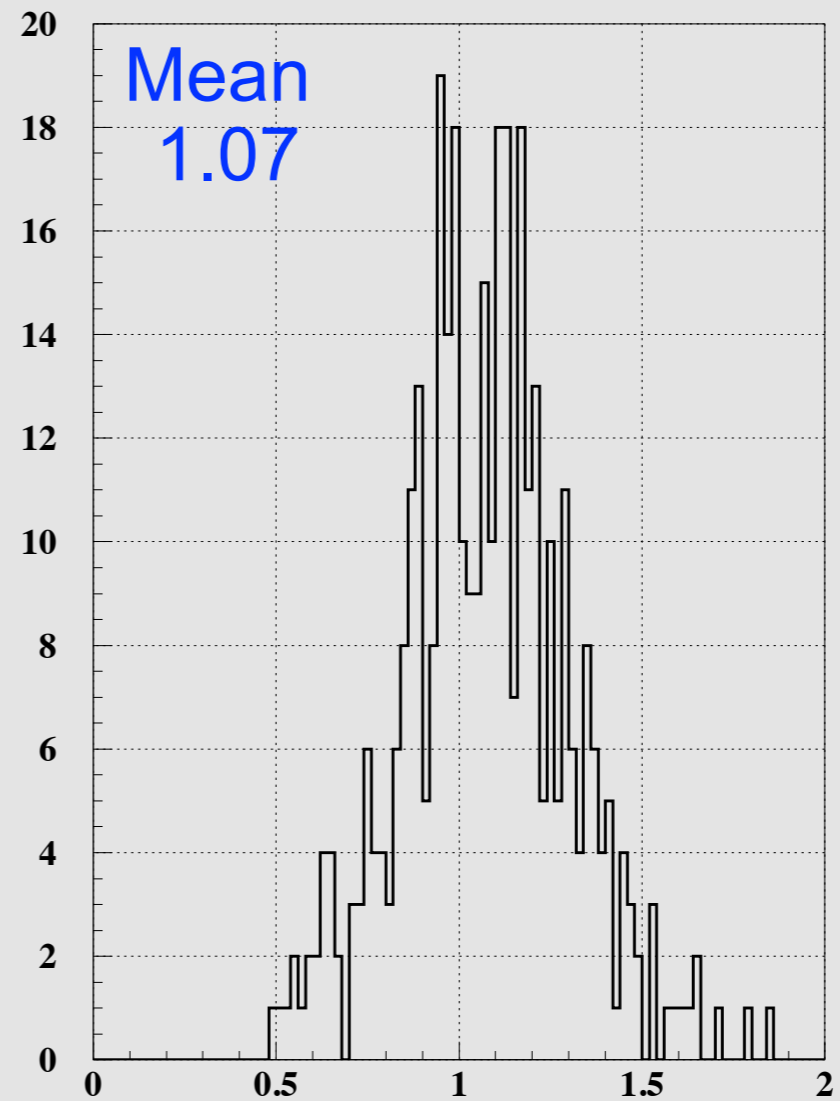

# Track quality

448 tracks

hits on track

369 tracks with >20 hits

$\chi^2/\text{ndf}$

# Summary

- ★ FHT with  $X(Y)$ ,  $Z(Y)$ 
  - ▶ Finds track in about every second event
- ★ Radial hit error
  - ▶ Fairly consistent with row distance /  $\sqrt{12}$
