ILC Running Scenarios

ILC Parameters Joint Working Group T. Barklow, J. Brau, K. Fujii, J. Gao, J. List, N. Walker, K. Yokoya

Background

- <u>Construction of the full 500 GeV ILC from the start</u> remains the preferred plan of the LCC
 - In response to 2013 suggestion (JAHEP) that a staged approach might be necessary the WG was charged to prepare a discussion on staging <u>should</u> <u>it be necessary</u>
 - Working group presented staging report to LCWS14 in Belgrade (ILC-NOTE-2015-066)
- Second recent study has been prepared
 - to compare various running scenarios for a 500 GeV machine
 - 2. to recommend a standard set of total integrated luminosities for use in physics studies

Construct 500 GeV from start

- 500 GeV scenarios study
 - TDR Baseline
 - Emphasizes higher energy strength of ILC
- Study parameters
 - assume 20 years of operation
 - compare 3 scenarios (studied more)
 - G20, H20, I20
 - Snowmass white paper studied also for comparison
 - arXiv:1310.0763 [hep-ph]
- Draft report: <u>http://pages.uoregon.edu/jimbrau/temp/</u> <u>parameters-draft-150419.pdf</u> - comments welcome!

Assumptions

- Full calendar year is assumed to be 8 months at a 75% efficiency (the RDR assumption). This corresponds to $Y = 1.6 \times 10^7$ seconds of integrated running. (significantly higher than a Snowmass year of 107 seconds.)
- A **ramp-up** of luminosity performance is in general assumed after:
 - (a) initial construction and after 'year o' commissioning;
 - (b) after a downtime for a luminosity upgrade;
 - (c) a change in operational mode which may require some learning curve (e.g. going to 10-Hz collisions).
- For initial physics run *after construction and year o commissioning*, the RDR ramp of 10%, 30%, 60% and 100% is assumed over the first four years.
- The ramp *after the shutdowns for installation of the luminosity upgrade* is assumed slightly shorter (10%, 50%, 100%) with no year 0.
- Going down in centre of mass energy from 500 GeV to 350 GeV or 250 GeV is assumed to have no ramp, since there is no machine modification.
- Going to 10-Hz operation at 50% gradient does assume a ramp (25%, 75%, 100%), since 10-Hz affects the entire machine.
- A major 18 month shutdown is assumed for the luminosity upgrade.
- Unlike TDR: 10-Hz and 7-Hz operation assumed at 250 GeV and 350 GeV

4

Polarization

	fraction with $sgn(P(e^{-}), P(e^{+})) =$								
	(-,+)	(+,-)	(-,-)	(+,+)					
\sqrt{s}	[%]	[%]	[%]	[%]					
250 GeV	67.5	22.5	5	5					
350 GeV	67.5	22.5	5	5					
500 GeV	40	40	10	10					

Table 2: Relative sharing between beam helicity configurations proposed for the various centerof-mass energies.

- TDR: $|P(e^{-})| = 80\%$, $|P(e^{+})| = 30\%$
- Cross sections depend on polarizations
 - s-channel Z/ γ allowed for $e_L e_R^+$ & $e_R e_L^+$, where Z favors $e_L e_R^+$
 - t-channel Z/ γ allowed for $e_L^-e_{L^+}$ and $e_R^-e_{R^+}$
 - BSM t-channel allows like sign helicities, but W or v_e t-channel exchange only for unlike sign helicities

Integrated Luminosities [fb]

J. Brau/ILC Parameters Jt WG - April 21, 2015

Higgs couplings (H-20)

- H-20 preferred for
 - slightly better early precision (compared to G-20)
 - current best reliability of m_h and $\sigma(e^+e^- \rightarrow Zh)$ measurements when done at 250 GeV
- Model independent
 - Higgs recoil from hadronic decaying Z is nearly model independent
- Recommended H-20 to ILC PAC last week

Recommended for ILC studies H-20

	first phase	lumi upgrade	total	Snowmass Lum-up [†]
250 GeV	500 fb-1	1500 fb-1	2 ab-1	1.15 ab-1
350 GeV	200 fb-1		0.2 ab-1	
500 GeV	500 fb-1	3500 fb-1	4 ab⁻1	1.6 ab-1
time	8.1 yrs	10.6 yrs	20.2 yrs*	

* includes 1.5 years for luminosity upgrade

† ILC Higgs whitepaper: arXiv:1310.0763

J. Brau/ILC Parameters Jt WG - April 21, 2015

Higgs mass

 Fundamental parameter of SM, important to know in own right

 Higgs decay partial width dependence on m_h requires 20 MeV m_h precision to achieve desired 0.2% on partial widths

- Higgs recoil from $Z \rightarrow \mu\mu$ (expect 1 MeV systematic uncertainty)
- Note direct reconstruction at 500 GeV in h → bb and → WW shows similar level of promise

Top electroweak couplings

• Left-handed top coupling, and the derived mass scale sensitivity for Kaluza-Klein excitations in and extradimensions model

Higgs self-coupling

550 GeV is 2.4 precision improvement over 500 GeV

550 GeV is 2.4 precision improvement over 500 GeVFailing to achieve 500 GeV loses reach quickly

Other issues considered

- BSM physics
 - Draft report discusses Light Higgsinos & WIMP dark matter & follow up energy scans for new particle discoveries
 - Examples of adjustments for BSM scenarios being prepared
- Model independency of $ZH \rightarrow qqH$
- WW threshold
- Z-pole for physics
- Z-pole for calibration
- Also, working on white paper regarding complementarity of ILC with circular collider

Issues for experiments

- Detectors
 - data taking at various repetition rates
 - 5, 7, 10 Hz
 - Z pole calibration requirement
- Physics
 - prospects for m_h measurement from kinematic reconstruction
 - model-independency of hadronic recoil

Recommendations to the PAC on TDR running scenario

- After considering various running scenarios for a 500 GeV machine, we put forward a preferred scenario based on current knowledge: H-20
 - 500 GeV startup, 20 yr duration
 - luminosity upgrade after 8 years
 - after several years of 500 GeV operation with upgraded luminosity, return to 250 GeV
- tth benefits from stretching to 550 GeV capability
- Actual running scenario will depend on physics results of LHC and early ILC
- Draft report: <u>http://pages.uoregon.edu/jimbrau/temp/</u> <u>parameters-draft-150419.pdf</u> - comments welcome!

Recommended for ILC studies H-20

	first phase	lumi upgrade	total	Snowmass Lum-up [†]
250 GeV	500 fb-1	1500 fb-1	2 ab-1	1.15 ab-1
350 GeV	200 fb-1		0.2 ab ⁻¹	
500 GeV	500 fb-1	3500 fb ⁻¹	4 ab⁻1	1.6 ab-1
time	8.1 yrs	10.6 yrs	20.2 yrs*	

* includes 1.5 years for luminosity upgrade

EXTRAS

Original Charge - early 2014

- Charge:
 - The ILC parameter working group reports to the LCC Directorate. It consists of members from both the ILC accelerator and the physics & detector groups where each team selects a co-convener for this working group.
 - This working group prepares information on ILC machine parameters and staging scenarios as well as potential upgrade paths in a form readily usable by the LCC. In doing so, the WG will take into account technical machine constraints and physics and detector needs regarding the fundamental ILC machine parameters such as energy, luminosity, crossing angles, etc.
 - <u>The first task for the working group is to prepare multiple</u> <u>scenarios for staging up to about 500 GeV.</u> The report should contain the pros and cons of each scenario as well as luminosities needed at each energy to produce corresponding physics results.

G-20 Luminosity profile
