

Study of Single-W process

Shinshu University
K. Tsuchimoto

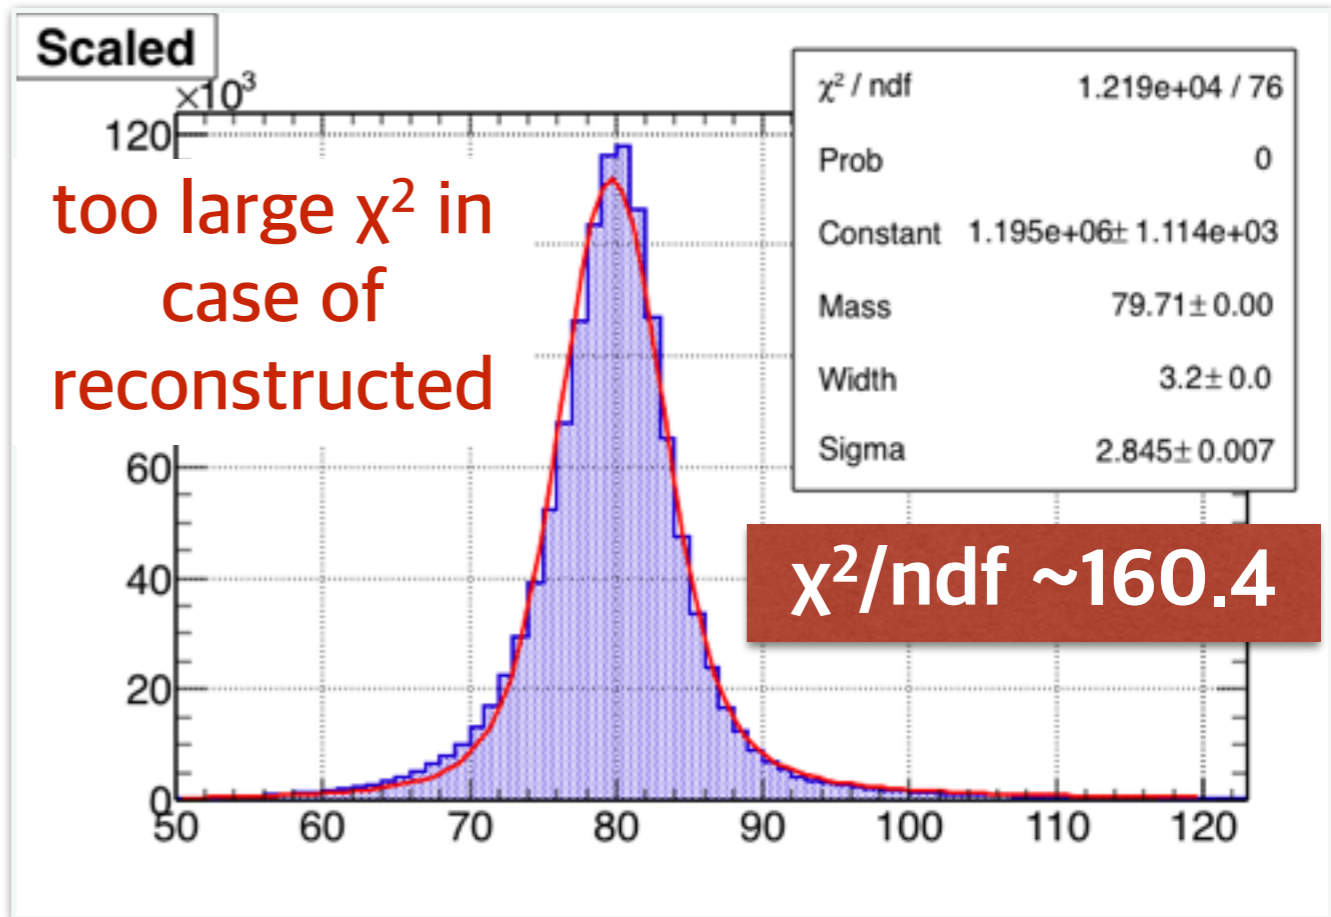

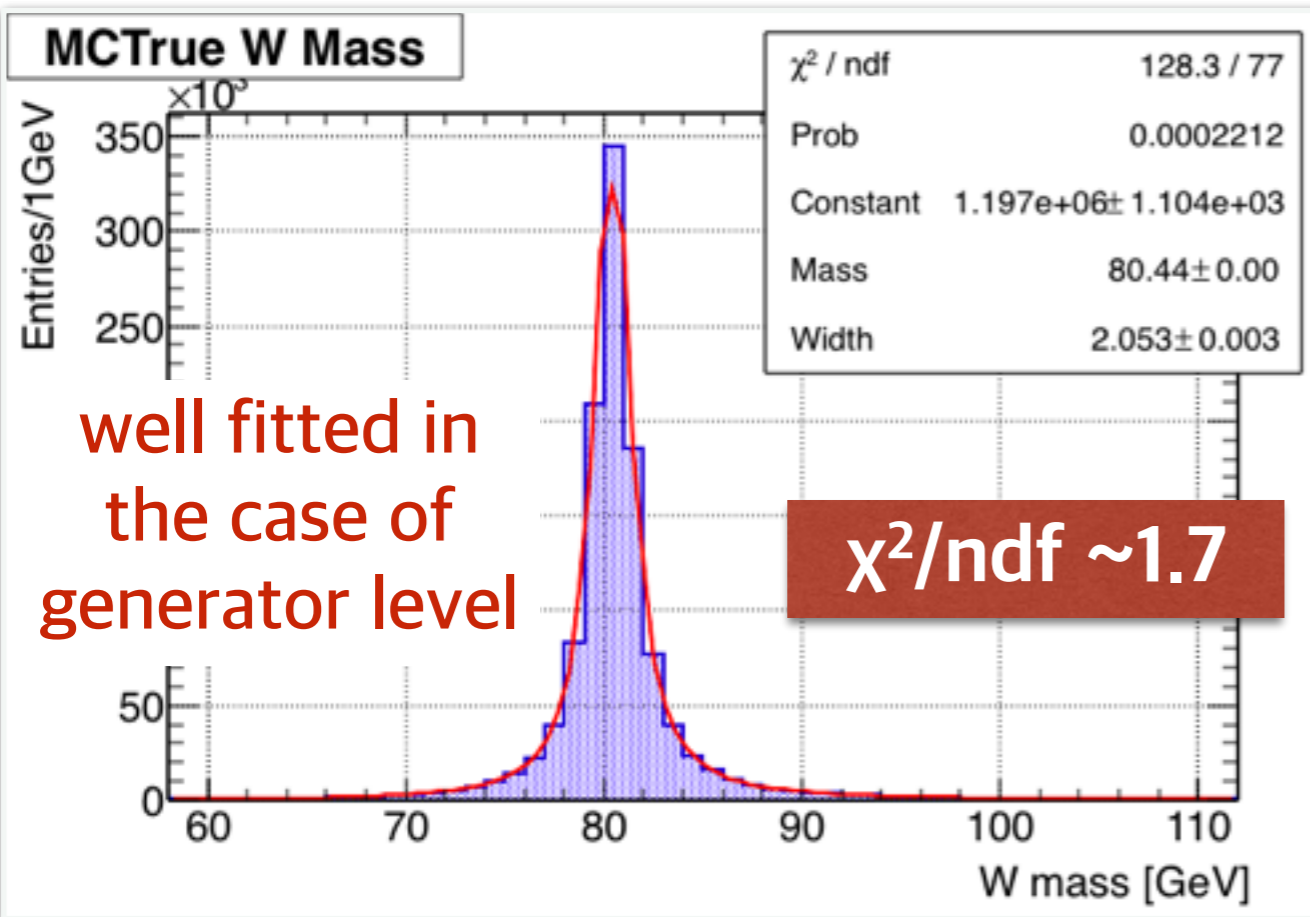

12th, December 2014 :

→ Current status & progress of my study

Status

- tried to do relativistic Breit-Wigner fit
- check the performance of FastJet in my analysis case

Fitting result improved

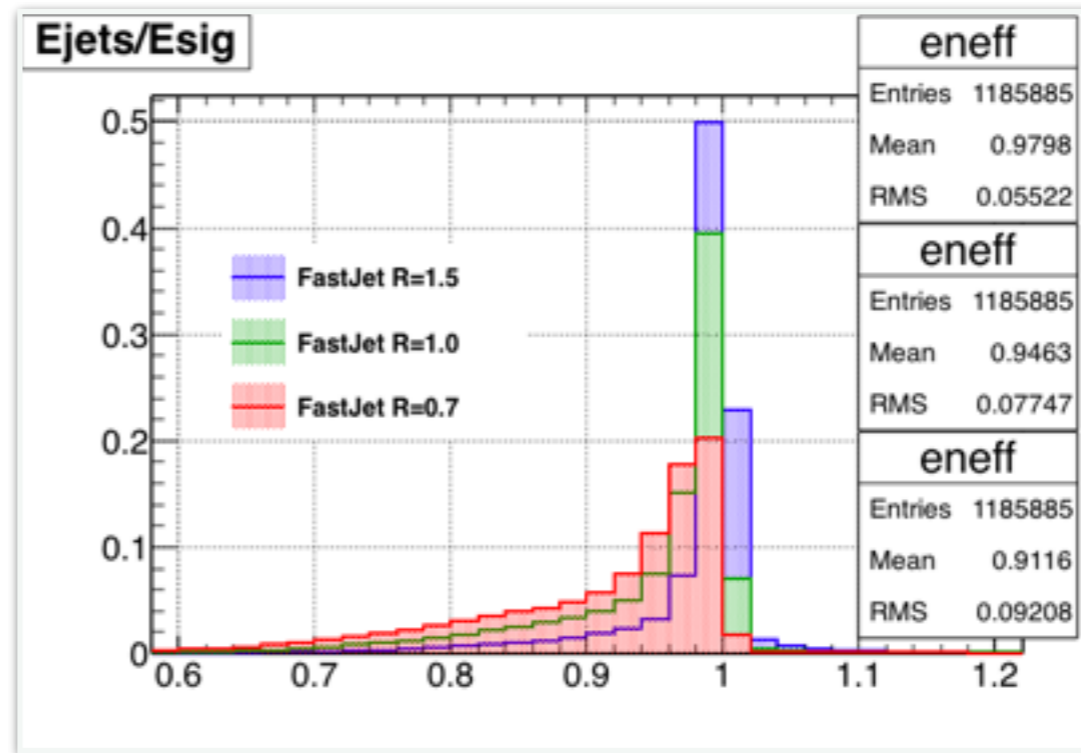

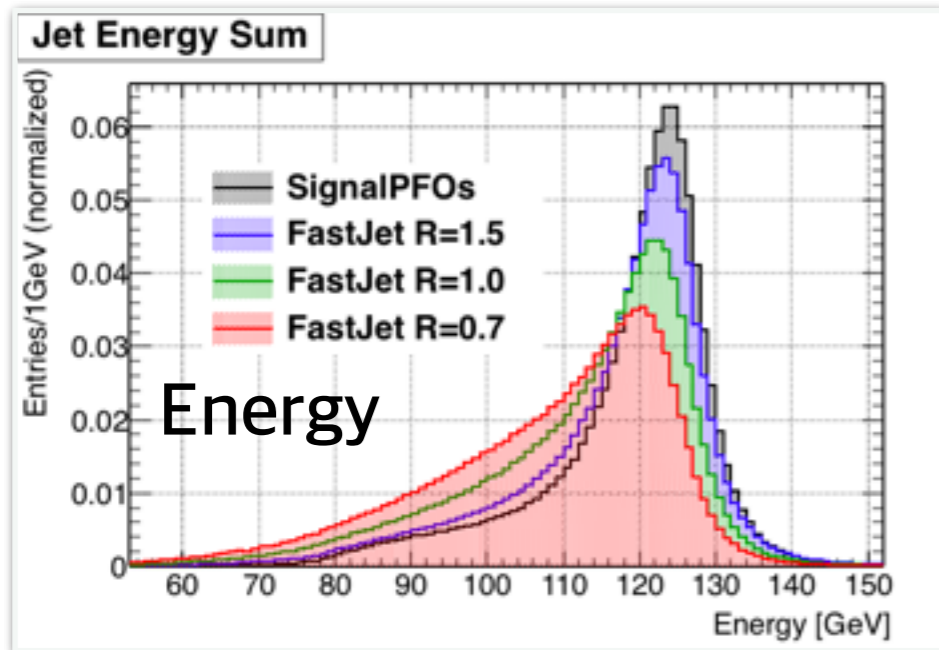

fitted with relativistic Breit-Wigner PDF

$$F(q; m_W, \Gamma) = \frac{N\Gamma(s)}{(q^2 - m^2)^2 + \Gamma(s)^2}$$

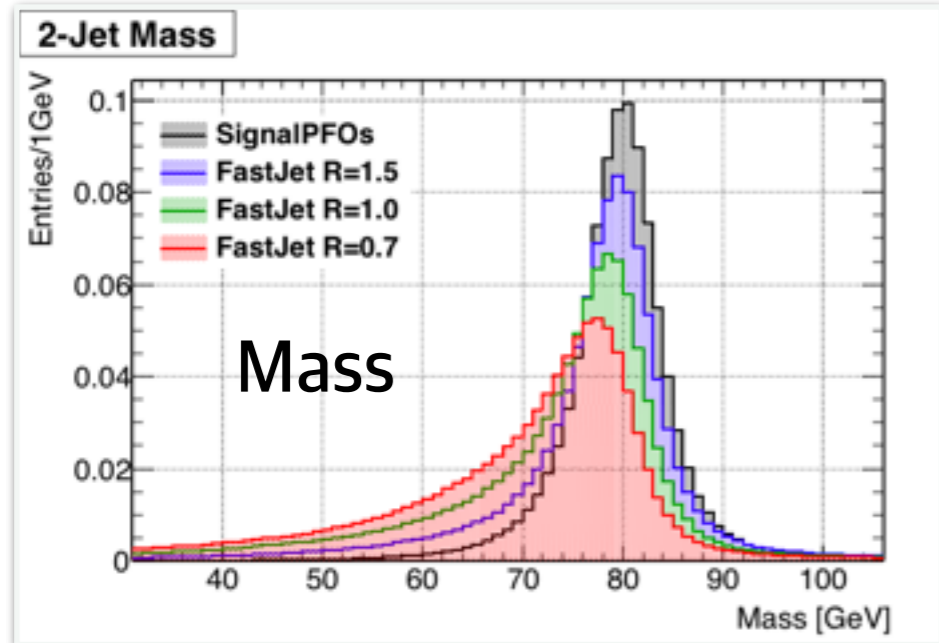

where $\Gamma(s) = m_W \Gamma_W \left(\frac{q^2}{m_W^2} \right)$

FastJet performance at evW 250GeV

2-jet

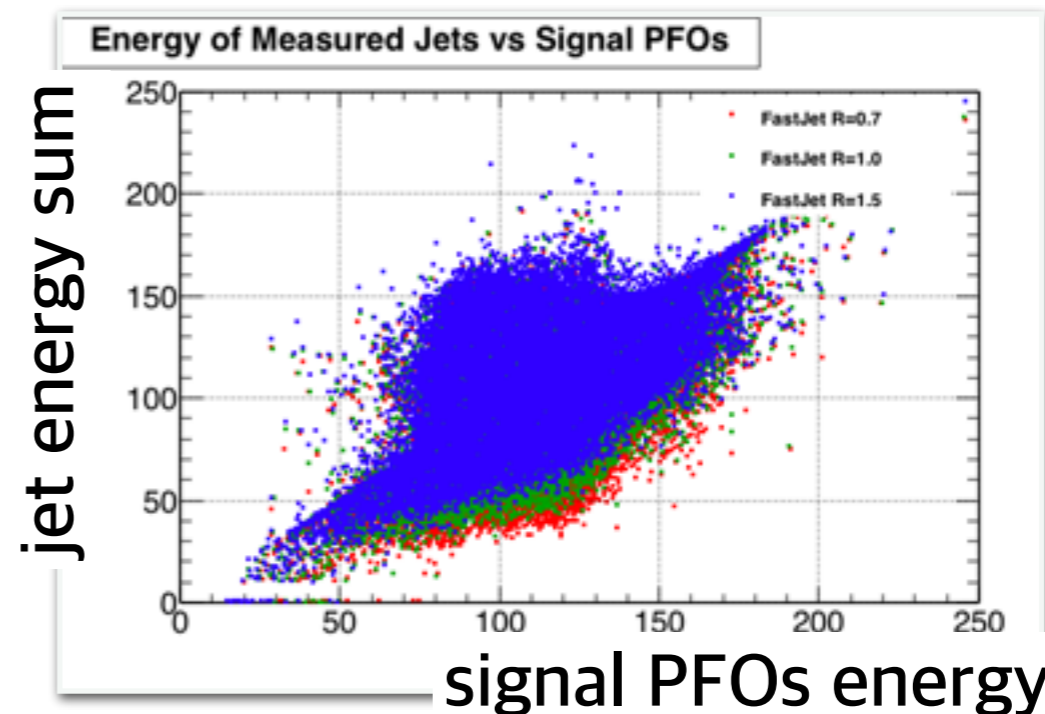

$$\frac{\Sigma E_{jets}}{E_{signal}}$$

when 2-jet, R=1.5 gives best performance

it seems to be there some 'missed' signal particles

Summary & Next

- I tried to fit the W mass peak
 - relativistic Breit-Wigner fit works well at generator level
 - but in case of scaled, it didn't works very well
- FastJet(kt_algorithm) gives best performance at $R=1.5$ for 2-jet case
- for the next,
 - MVA approach to tag ISRs and overlays (if necessary)
 - error study
 - impact of different calorimeter option study in this direct m_W measurement case
