Generator Group Status Report

LCWS 15 1 / 13

Outline

- 3 Whizard 1 \rightarrow Whizard 2
 - 4 Non-whizard issues
- 5 Conclusions and Outlook

Introduction

Introduction

- Group formed to select generator to generate physics events for the DBD benchmarks, including all relevant backgrounds.
- ⇒ Generate the entire SM at 1 TeV. At least 500 fb⁻¹, except for very high cross-section processes (γγ, Compton, Bhabha).
- Members: A. Miyamoto, T. Barklow, M. B., CLIC (at the time S. Poss, now P. Roloff)
- Also used to produce 250, 350 and 500 GeV data-sets.
- Presently, the group doesn't really exist our mandate was for the DBD.
- However, we decided to get back into business, because:
 - New, better Whizard.
 - Developments in reconstruction.
 - Lack of statistics in some cases.
 - Things that went wrong in DBD & friends: Double-counted channels, beam-spot, un-physical γγ events, ..

• Much improved steering: Sindarin.

- Samples from new BSM models much easier to create, using tools like SARAH.
- 8 fermion final states possible (*ttH* !). Was not (practically) possible with Whizard 1.95, so these DBD samples were made with Physim.
- Match hard gluon radiation from Whizard hard process with gluons in parton-shower and hadronisation. Can, within Whizard, compare this with DBD recipe (α_s = 0 in Whizard + Pythia for both parton-shower and hadronisation) ⇒ systematics evaluation.
- Improved treatment of $t\bar{t}$ threshold.
- Easier to study of impact of beam parameters: GUINEAPIG beam-simulation directly input to Whizard (the CIRCE2 component).

Status of Whizard-2 for ILC: Output format and interfaces

- Correct stdhep output: In latest α release (2.2.8alpha) the stdhep output format is as expected, ie. as it would be by outputting HEPEVT directly after PYTHIA hadronisation. However HEPEV4 output still missing (Spin and colour-flow).
- Fringe-benefit: when it works Whizard can also directly output LCIO.
- Interface to PYTHIA:
 - In Whizard 1.x, this was external to Whizard, and implemented in our user-routine, user.f90 (mostly by Tim)
 - In Whizard 1.95: Colour-flow from Whizard used to to set up the event-record for correct treatment in Pythia, also done by us.
 - In Whizard 2: Interface is internal to Whizard, but the way to transfer Colour-flow changes between versions.
 - In Whizard 2.2.8alpha: Direct filling of Pythia common blocks ⇒ Validation done!

Status of Whizard-2 for ILC : Polarised τ decays

- Whizard produces correctly polarised *τ*:s ⇒ need to correctly decay polarised *τ*:s ⇒ TAUOLA.
- But: Pythia doesn't handle polarised decays; allows for user plug-in to do *τ*-decays.
- → Need to "leap-frog" polarisation information from Whizard over the polarisation-blind Pythia to TAUOLA.
- ILC-Whizard-1.95: done in user.f90.
- Whizard-2: no user.f90 anymore → How to do it now?
- Whizard authors intend to do τ -decays within Whizard. Timescale?

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Status of Whizard-2 for ILC : $H \rightarrow \tau \tau$ or $H \rightarrow \gamma \gamma$

- Obviously, Whizard can only transfer the full spin correlation for *τ*'s it knows about.
 - \Rightarrow the spin correlation between the τ :s from a Higgs decay (done in Pythia) is lost in the DBD samples.
 - For Whizard 1, H had to be decayed by Pythia: Whizard is tree-level, ie. no loop-induced decays $(H \rightarrow \gamma \gamma!)$
 - In Whizard 2, effective vertices exist \rightarrow loop decays of H possible \Rightarrow
 - Let Whizard *decay* H, with constraint on intermediate state = Higgs,
 ⇒ polarised *τ*:s ! Caveat: Can one set BR's ?!

Status of Whizard-2 for ILC : $H \rightarrow \tau \tau$ or $H \rightarrow \gamma \gamma$

- Obviously, Whizard can only transfer the full spin correlation for *τ*'s it knows about.
 - \Rightarrow the spin correlation between the τ :s from a Higgs decay (done in Pythia) is lost in the DBD samples.
 - For Whizard 1, H had to be decayed by Pythia: Whizard is tree-level, i.e. no loop-induced decays $(H \rightarrow \gamma \gamma!)$
 - In Whizard 2, effective vertices exist \rightarrow loop decays of H possible \Rightarrow
 - Let Whizard *decay* H, with constraint on intermediate state = Higgs,
 ⇒ polarised *τ*:s ! Caveat: Can one set BR's ?!

Whizard 2 offers two possibilities

- O CIRCE 2: Do \sim what user.f90 did use GUINEAPIG output to automatically create an MC-generator of the beam-spectrum
 - Observed significant (factors >> 1) slow down \Rightarrow ask Authors to profile CIRCE2
 - Initially, did not work with polarised beams. Now fixed by authors.

Idirect read-in" of "beam event files": Works, also with polarisation

- Draw-back: Needs huge statistics in GuineaPig files, probably not efficient for mass- production.
- Advantage: Very useful for studying impact of beam parameters .
- Ison both methods: Need to validate wrt. DBD.

イロト イ団ト イヨト イヨト

- Technical requirements for mass production in batch mode:
 - Initially, option to specify maximum file size + automatic file splitting was missing. Now added by authors.
 - Steering by command line options.
- For fast simulation: need callable interface (ie. no intermediate generator files).
- Double counting in $e^+e^- \rightarrow e^+e^-f\bar{f}$:
 - Problem: if γ* and e massless, p_t-kick from Weizsäcker-Williams γ violates 4-momentum conservation ⇒ unphysically large p_t-kick on e ⇒ cut used to separate e⁺e⁻ → e⁺e⁻ff from γγ and from ZZ etc. fails ⇒ double-counting. Routes to solve this:
 - (a) Do (a) (b) -
 - Gin ply reject events with pekick of a larger than allowed by given Q

- Technical requirements for mass production in batch mode:
 - Initially, option to specify maximum file size + automatic file splitting was missing. Now added by authors.
 - Steering by command line options.
- For fast simulation: need callable interface (ie. no intermediate generator files).
- Double counting in $e^+e^- \rightarrow e^+e^-f\bar{f}$:
 - Problem: if γ* and e massless, p_t-kick from Weizsäcker-Williams γ violates 4-momentum conservation ⇒ unphysically large p_t-kick on e ⇒ cut used to separate e⁺e⁻ → e⁺e⁻ff from γγ and from ZZ etc. fails ⇒ double-counting. Routes to solve this:
 - - Simply reject events with p-kick of a larger than allowed by given Q.

- Technical requirements for mass production in batch mode:
 - Initially, option to specify maximum file size + automatic file splitting was missing. Now added by authors.
 - Steering by command line options.
- For fast simulation: need callable interface (ie. no intermediate generator files).
- Double counting in $e^+e^- \rightarrow e^+e^-f\bar{f}$:
 - Problem: if γ^* and e massless, p_t -kick from Weizsäcker-Williams γ violates 4-momentum conservation \Rightarrow unphysically large p_t -kick on $e \Rightarrow$ cut used to separate $e^+e^- \rightarrow e^+e^-f\bar{f}$ from $\gamma\gamma$ and from ZZ etc. fails \Rightarrow double-counting. Routes to solve this:
 - Do $e^+e^- \rightarrow e^+e^-f\bar{f}$ down to $m_e > 0$ without cut-off? \rightarrow needs quadruple precision in integration and event generation + work of > 1 month
 - Simply reject events with pt-kick of e larger than allowed by given Q² cut

- Technical requirements for mass production in batch mode:
 - Initially, option to specify maximum file size + automatic file splitting was missing. Now added by authors.
 - Steering by command line options.
- For fast simulation: need callable interface (ie. no intermediate generator files).
- Double counting in $e^+e^- \rightarrow e^+e^- f\bar{f}$:
 - Problem: if γ^* and e massless, p_t -kick from Weizsäcker-Williams γ violates 4-momentum conservation \Rightarrow unphysically large p_t -kick on $e \Rightarrow$ cut used to separate $e^+e^- \rightarrow e^+e^-f\bar{f}$ from $\gamma\gamma$ and from ZZ etc. fails \Rightarrow double-counting. Routes to solve this:
 - Do $e^+e^- \rightarrow e^+e^-f\bar{f}$ down to $m_e > 0$ without cut-off? \rightarrow needs quadruple precision in integration and event generation + work of > 1 month
 - Simply reject events with p_t-kick of e larger than allowed by given Q² cut

- gluon matching between ME and PS:
 - Now: no gluons included in ME (setting α_s = 0) to avoid double-counting with (unmatched) parton shower in Pythia.
 - Whizard 2 can do it's own parton-shower with "MLM matching".
 - For now: stick with old scheme for mass-production, but make dedicated comparisons for multi-jet final states (eg *tt* background for ttH or ZZH)
- 8 fermions:
 - Whizard 1: Choked on 8 fermion →: source code generated by O'Mega (the matrix element code generator) could reach several GB in size ⇒ Physsim in DBD for ttH
 - Whizard 2: Scaleble option: generated "byte code" running in a "virtual machine" (think Java!). Should work for 8f. Need to validate.
- Medium-term whishes:
 - γ ISR/FSR matching
 - Work out priority processes for EW-NLO (!)

- Dedicated radiative Bhabha generator:
 - LEP generators with treatment of collinear divergencies etc.
 - BHWIDE used for CLIC luminosity spectrum study (A.Sailer). Do the same? If so, how to implement beam-spectrum ?
 - Work ongoing in CLIC group on new NLO generator (Vladimir Makarenko).
 - Some efforts to use GRACE have also been done.
- $\gamma\gamma$ in general: Pythia is much more elaborate than Whizard. However, Pythia6 out-of-the-box can't handle beam-spectrum for these processes. Possible way:
 - Use Whizard to generate γ :s (virtual or real)
 - Feed these as input photon-beams to Pythia.
 - DIS category probably missing ?!

 Some work started to incorporate γγ-physics into Pythia8 (arXiv:1510.05900).

• More specifically: $\gamma\gamma \rightarrow \text{low-p}_t$ hadrons:

- Present (DBD) procedure:
 - As above: let Whizard do the γ:s.
 - If $M_{\gamma\gamma} > 10$ GeV: Use Pythia as above.
 - Else: Cross-section from formula (Amaldi & al.) final state is two mesons, either ρρ, ρπ or ππ, depending on M₂₂
- Unphysical invariant mass distributions observed on files currently used in overlay.
- Seems possible to go much lower in $M_{\gamma\gamma}$ with PYTHIA than what was done in the DBD. Not quite to 2 m $_{\pi}$, but does that matter ?
- See Swathi Sasikumar's talk on Thursday morning on current capabilities of Pythia.

 - Unphysical invariant mass distributions observed on files currently used in overlay.
 - Seems possible to go much lower in $M_{\gamma\gamma}$ with PYTHIA than what was done in the DBD. Not quite to 2 m $_{\pi}$, but does that matter ?
 - See Swathi Sasikumar's talk on Thursday morning on current capabilities of Pythia.

Lots of goodies in Whizard 2 ⇒ Main issue right now is to make Whizard 2 fly for ILC:

- A few things missing in the output format.
- TAUOLA interface needed, or alternatively τ decays by Whizard.
- For FastSim: Speed when using Circe2 for beam-spectrum callable Whizard.
- Testing and Validation
- Working closely with the authors to finalise this.
- Further issues: Learn from lessons of DBD studies
 - Fix issues like vertex smearing.
 - Re-visit $\gamma\gamma$
 - Other specialised generators for things like Bhabha ?
