Samples used in this study

File path at KEKCC:

15, 500 GeV sample

```
/hsm/ilc/grid/storm/prod/ilc/mc-opt.dsk/ild/dst/500-TDR_ws/flavortag/ILD_15_o1_v02_nobg/v01-19-06-p01
```

DBD, 500 GeV sample (produced privately by Junping)

```
/group/ilc/suehara/reco/dbd/train-lcfiplus/6q-jp/dst_E500
```

- **6b, 6c, 6u, 6d, 6s processes**
- **No beam background**
- **Processed with v01-19-06**
- **Reprocess from vertexing to set beam constraint**

Flavour Tagging (Nominal)

btag

ctag

1: I5_500GeV flavour tag sample (w/o beam bkg.)

2: DBD_500GeV flavour tag sample (w/o beam bkg.)

Beam (constraint) size is set to be the latest configuration.

Need to find what causes this difference.

Flavour Tagging (A trial)

Remove some variables (e.g. vtxmass) for training.

btag

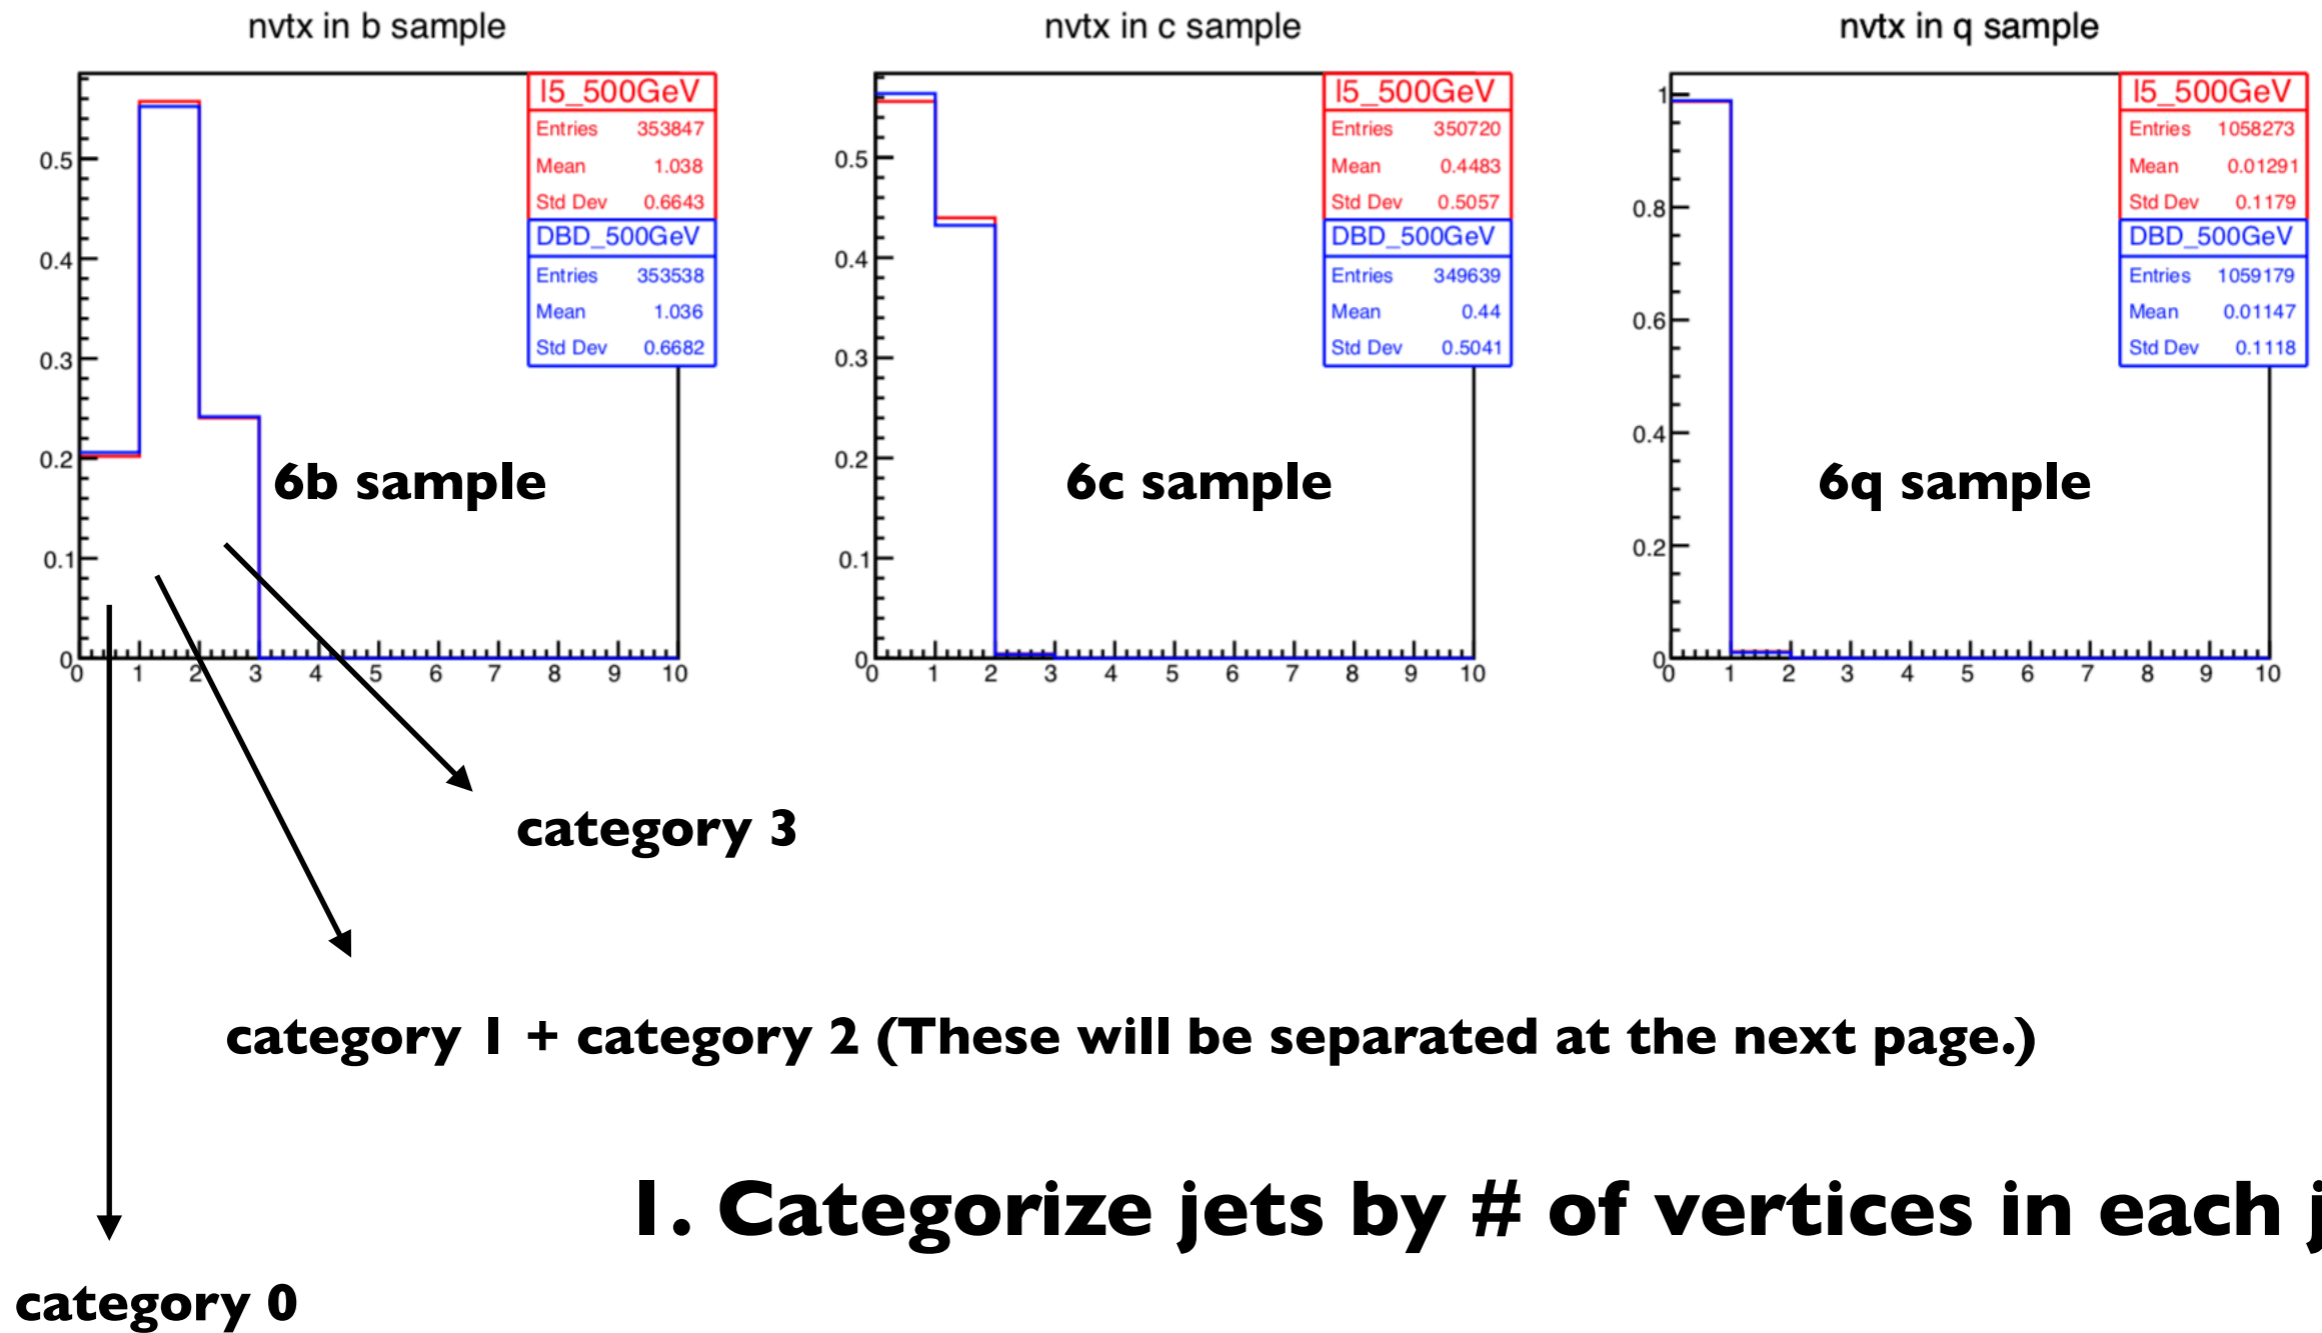

ctag

**Variables removed for this trial are probably the key.
But still need more investigation.**

Categorize jets for Flavour tagging (I)

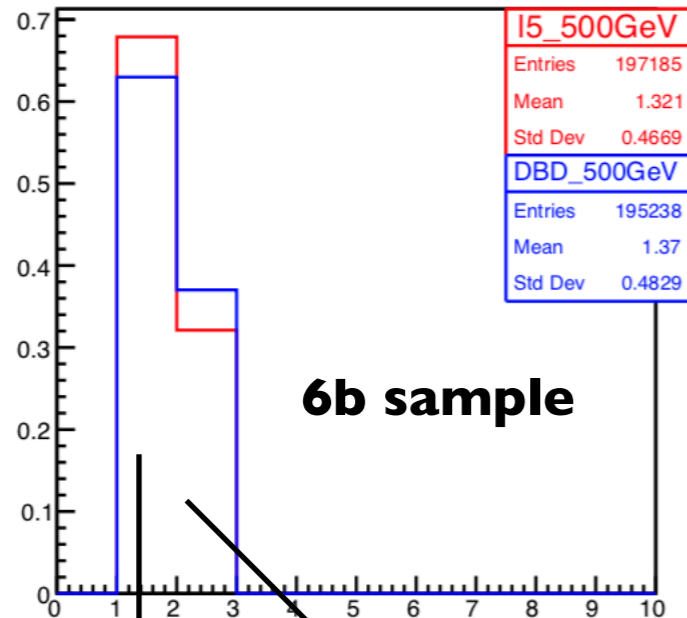

I. Categorize jets by # of vertices in each jet

6q sample likely has no vertex in jets.

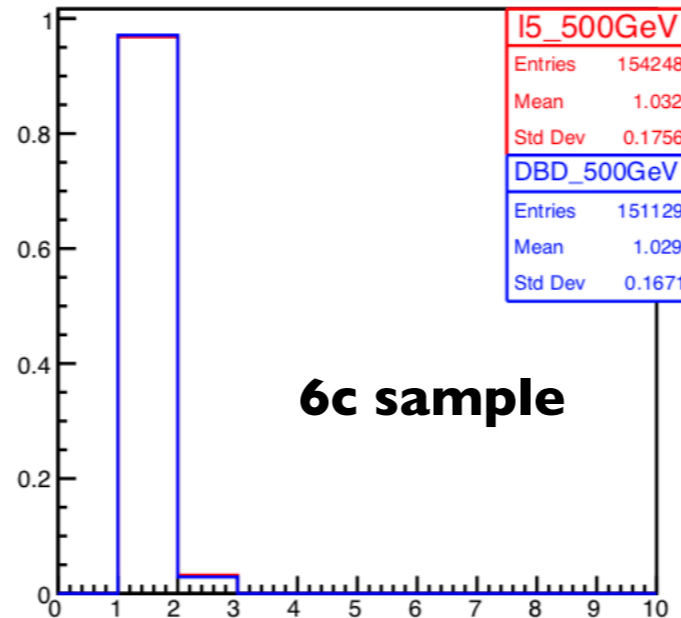

Categorize jets for Flavour tagging (2)

nvtxall in b sample

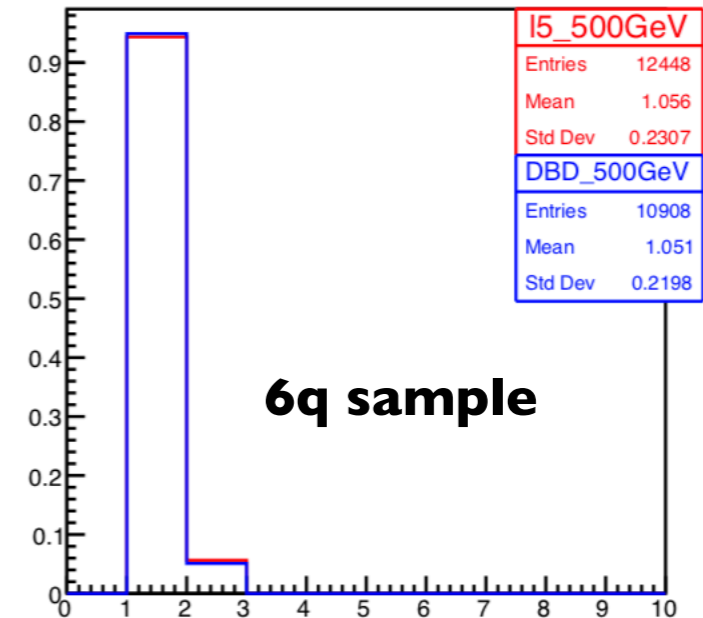

6b sample

nvtxall in c sample

6c sample

nvtxall in q sample

6q sample

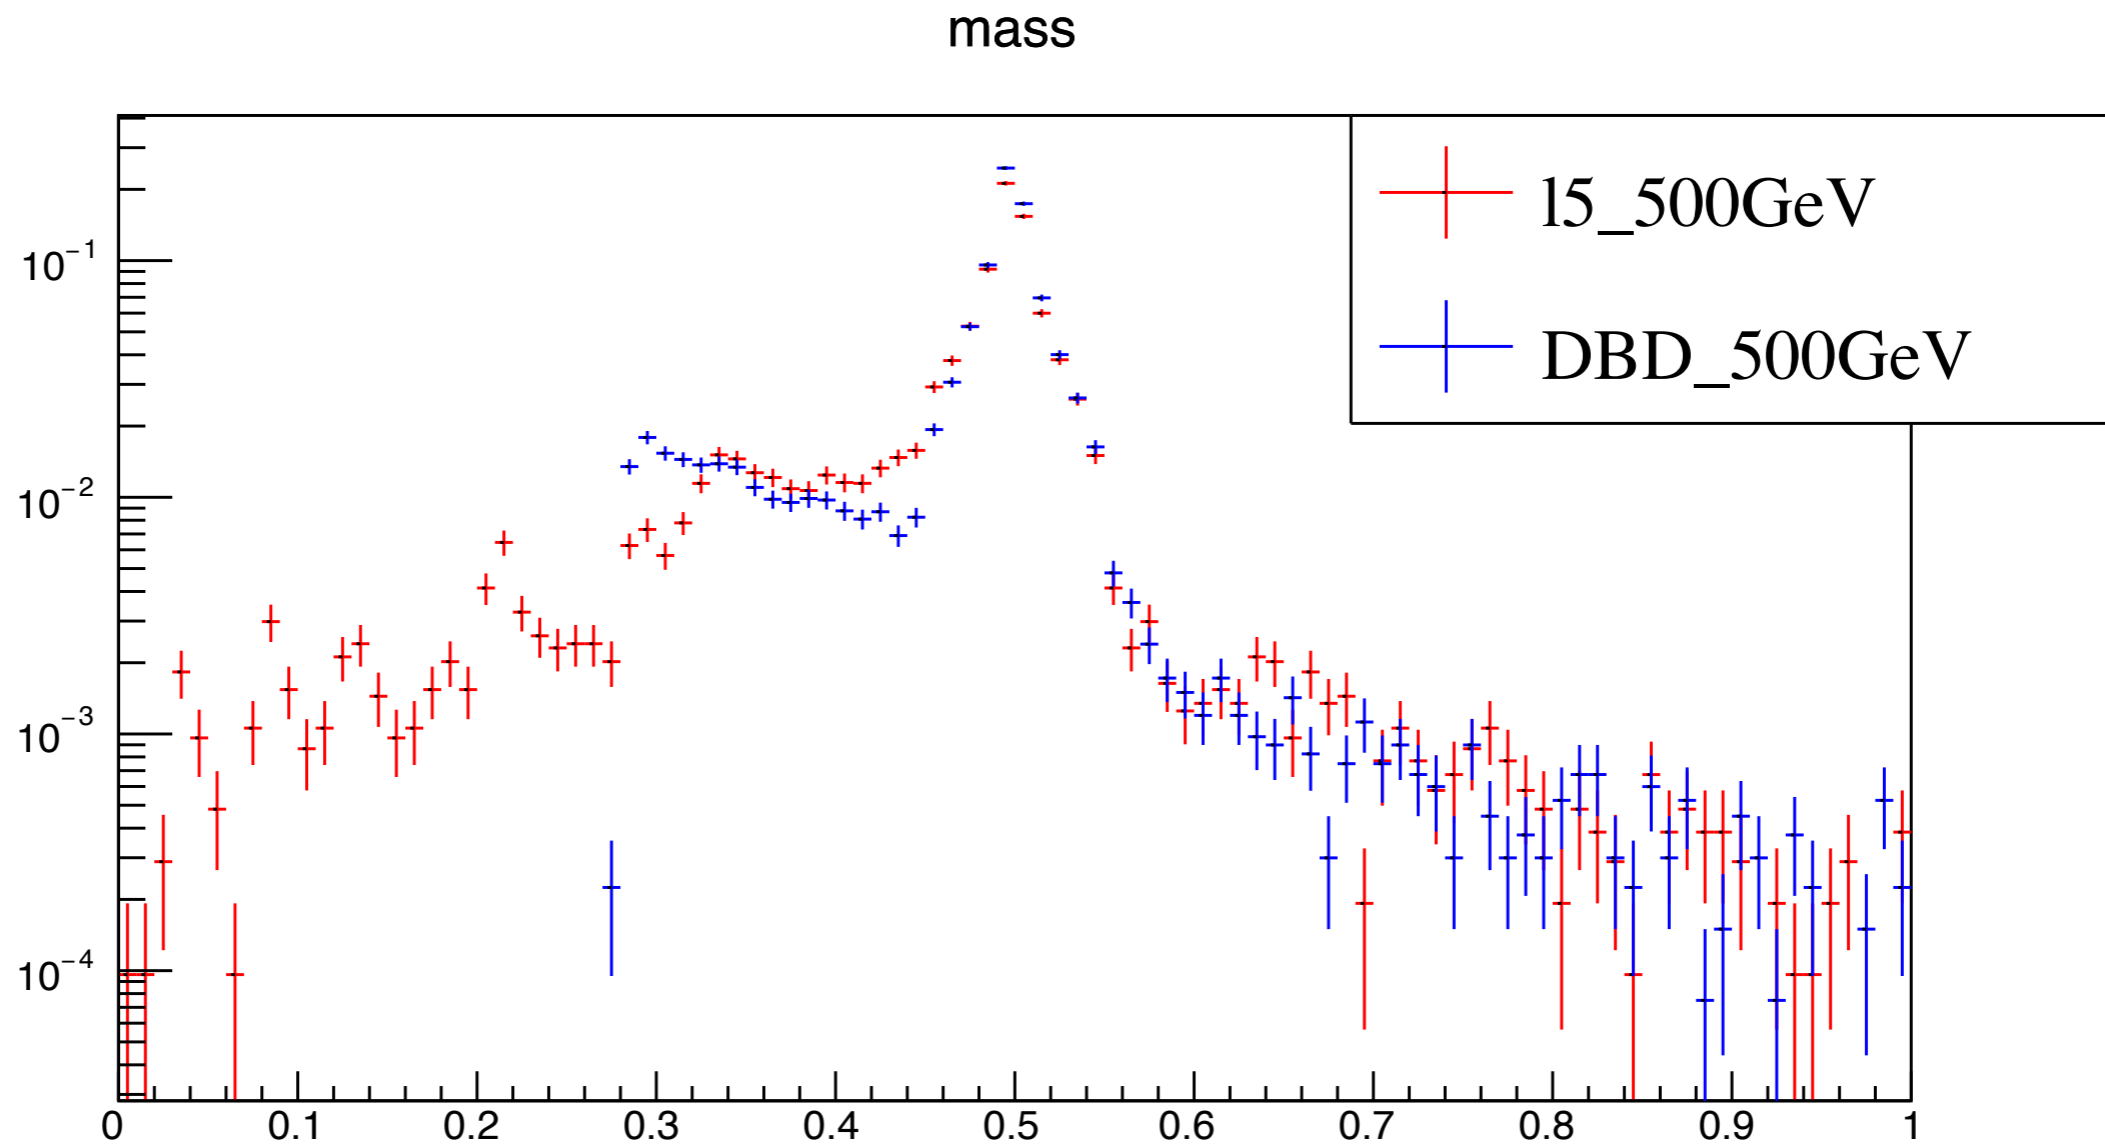

category 1 (# of pseudo vtx = 0)
category 2 (# of pseudo vtx = 1)

category 1 + category 2 (These will be separated at the next page.)

2. For jets having one vertex, check # of pseudo vertex (= 1 track vertex)

of pseudo vertex may also be a clue.

V0 vertex mass

V0 vertex may also be a clue.
