

# The ILC as a natural SUSY discovery machine and precision microscope: from light higgsinos to tests of unification

*Howard Baer<sup>1</sup>, Mikael Berggren<sup>2</sup>, Keisuke Fujii<sup>3</sup>, Jenny List<sup>2</sup>, Suyi-Leena Lehtinen<sup>2</sup>, Tomohiko Tanabe<sup>4</sup>, Jacqueline Yau<sup>3</sup>*

The fact that we find that among the seven differences as much better than among the individual scores as the  $\bar{X}$  suggests that due to the overlapping distributions there could not be any reliable differentiation. But still the seven differences are almost as reliable. I think it should be discussed in a bit more detail.

new(3)

    |> new(3) < "boundary" --> "boundary"

10/29  
11) "removed hard file reference and parameter 'clobber'." == Nclobber (overwritten) the char file named  
12) "removed" to 14 after "remove".

1987-88 - 1988-89 - 1989-90

10-25  
The improvements (that 22 over 73), which are closest to the truth, are also the few best. The next 10 would be used for long-term as the last 10 indices.

**Fig. 20.** Survival against insertion of various fitted prostheses.
