◉ LCFIPlus with SGV

Even after some typo fixes in a SGV steering file, there are still clear discrepancies between SGV samples and DBD full det. sim. samples in the flavour tag performances.

➡ Need to compare event by event to clarify what is going on. It seems that the best way is to generate small samples for both full det and SGV by myself to make a fair comparison (one-to-one correspondence between stdhep file and reco file makes life easier).
