

Progress

► Make samples which is assumed majorana.

- $M_{RHN} = 200\text{GeV}$
- $\sqrt{s} = 500\text{ GeV}$, ILC beam spectrum + ISR

→ Now analyzing

Cross section[fb]

► I study Delphes-mini-DST. (<http://ilcsnowmass.org/>)

How to produce RHN at ILC

- 4 fermions
- single W
- semileptonic decay
- Ignore hadronic shower

Condition

- Whizard generator 2.8.4
- UFO model from Arindam Das
- 100% beam polarization
- $\sqrt{s} = 500$ GeV, ILC beam spectrum + ISR
- $M_{RHN} = 200, 300, 400, 450$ GeV
- MC particles, no hadronization
