

FCAL software and analysis meeting, 11 November 2020,

Meeting Minutes

The meeting was dedicated to the TB2020 data analysis:

Pavel presented a few slides about the noise level from SRS read-out system. He compared his histograms with Veta's plots. There are a few differences due to the used method for noise extraction. He used the arithmetic mean among all events. He will continue to identify the "bad" channels first by eye and then using selection criteria.

Roma will have a look on FLAME data, she asked also about telescope data.

Good news from Kiev, **Elizaveta** has a look at SRS data and she hopes to present some plots about shower development at the next meeting.

Ivan still fights to install libraries required by codes used in SRS data analysis.

The next meeting will be in 2 weeks, on 25 November 2020 at 4 pm CERN time zone.
