

About a Comment in the Review Report

- There was a claim in sources subgroup about the text

“Within the limited time available in this review, the electron-driven source appears to be the ‘lower risk’ candidate. However, the **baseline requirement** of polarisation cannot be ignored. This suggests that the undulator-based source would be the favored candidate IF feasibility can be assured.”

- Tor states this should read as

“Within the limited time available in this review, the electron-driven source appears to be the ‘lower risk’ candidate. However, the advantages of positron polarisation cannot be ignored and hence a polarized e+ source was the baseline choice in the ILC TDR. This suggests that the undulator-based source would be the favored candidate IF feasibility can be assured.”
