The SiD Digital ECal based on Monolithic Active Pixel Sensors

Wednesday, 27 October 2021 13:00 (20 minutes)

Jim Brau (U. Oregon), Martin Breidenbach (SLAC), Lorenzo Rota (SLAC), et al.

The SiD Collaboration has had a long interest in the potential for improved granularity in the tracker and ECal; a study of MAPS in the SiD ECal was described in the ILC TDR. Work is progressing on the MAPS application in an upgraded SiD design, both for the ECal and tracking. A prototyping design effort is underway for a common SiD tracker/ECal design based on stitched reticules to achieve $10 \times 10 \text{ cm}^2$ sensors with $25 \times 100 \text{ micron}^2$ pixels. Application of large area MAPS in these systems would eliminate delicate and expensive bump-bonding. The small pixels significantly improve shower separation. Recent simulation studies confirm previous results, indicating electromagnetic energy resolution based on digital hit cluster counting provides better performance than the SiD TDR analog design based on 13 mm^2 pixels. Furthermore, two shower separation is excellent down to the millimeter scale. Geant4 simulation results will be presented demonstrating these expectations.

1st preferred time slot for your oral presentation

10:00-12:00 JST (3:00-5:00 CEST, 21:00-23:00 EDT, 18:00-20:00 PDT)

2nd preferred time slot for your oral presentation

13:00-15:00 JST (6:00-8:00 CEST, 0:00-2:00 EDT, 21:00-23:00 PDT)

Primary authors: BRAU, Jim (University of Oregon (US)); ROTA, Lorenzo (SLAC); BREIDENBACH, Martin (SLAC)

Presenter: BRAU, Jim (University of Oregon (US))

Session Classification: B-1: Calorimeters

Track Classification: Parallel sessions: Detectors: Session B: Calorimeters
