# 1. Motivation

To find new physics via  $H\gamma\gamma$  and  $H\gamma Z$  couplings

Higgs to  $\gamma Z$  coupling in the Standard Model (SM) is a loop induced coupling.  
 → We expect BSM amplitude can be larger than SM amplitude.

e.g. : Inert Triplet Model

This process can be also useful to constrain the dimension 6 EFT operators which can introduce effective anomalous  $h\gamma Z$  and  $h\gamma\gamma$  couplings.

Q. H. Cao, et al, arXiv:1505.00654 [hep-ph]

Any deviation of the **coupling constants from SM** signals new physics.

# 2. Theoretical framework for our analysis

## SM one-loop predictions

## The main Feynman diagrams

Mawatari, et al, arXiv:1808.10268

SM cross sections by one loop calculation:

$\sigma_{SM} = 0.35 \text{ fb}$  for  $(-100\%, +100\%)$   
 $\sigma_{SM} = 0.016 \text{ fb}$  for  $(+100\%, -100\%)$

$\sigma_{SM} = \mathbf{0.20 \text{ fb}}$  for  $(-80\%, +30\%)$   
 $\sqrt{s} = 250 \text{ GeV}$

**Small !**

This analysis is very challenging.

\*For unpolarized beam  
Destructive interference

### 3. Experimental Method

The effective field theory (EFT) Lagrangian (model-independent)

$$L_{\gamma H} = L_{SM} + \frac{\zeta_{AZ}}{v} A_{\mu\nu} Z^{\mu\nu} H + \frac{\zeta_A}{2v} A_{\mu\nu} A^{\mu\nu} H$$

$A_{\mu\nu}, Z_{\mu\nu}$  : field strength tensors

$v$ : vacuum expectation value

cross section of  $e^+e^- \rightarrow \gamma H$

Phys.Rev. D94 (2016) 095015

$$\frac{\sigma_{\gamma H}}{\sigma_{SM}} = 1 - 273\zeta_A - 201\zeta_{AZ} \quad (\text{eLpR})$$

$$\frac{\sigma_{\gamma H}}{\sigma_{SM}} = 1 + 492\zeta_A - 311\zeta_{AZ} \quad (\text{eRpL})$$

Since  $\zeta_A$  is already constrained by measurement of  $H \rightarrow \gamma\gamma$  branching ratio at LHC, we can extract  $\zeta_{AZ}$  parameter by just measuring cross section for a single beam polarization.

## 4. Simulation framework

- $\sqrt{s}=250$  GeV  
Integrated Luminosity: 2000 fb<sup>-1</sup>  
(900 fb<sup>-1</sup> each for Left / Right handed pol.)
- background : 2f,4f (DBD sample)
- ISR and Beamstrahlung effects are included
- **ILD full simulation (Mokka)**
- Geant4 based, realistic detailed detector model
- Full reconstruction chain from detector signals to 4-vectors  
(iLCSoft v01-16-02/ MarlinReco, PandoraPFA, LCFI+, Isolated photon finder, jet clustering )
- $E_\gamma > 50$  GeV

## 9. Pre-Event selection

---

- Isolated photon

- Photon ID
- $E_\gamma > 50 \text{ GeV}$

- ※ The split photon clusters within a small cone are recovered
  - $(\cos\theta_{\text{cone}}=0.998)$

→ Left events except photon

- 2jet clustering (Durham)
- Flavor tagged (LCFI+)

For  $h \rightarrow WW^*$  semi-leptonic,

number of decay w to qq=1

## 5. Analysis - Event selection

Signal:  $e^+e^- \rightarrow \gamma H \rightarrow \gamma(bb)$

### Signal signatures

1. Isolated monochromatic photon with energy 93 GeV
2. 2 b jets
3.  $m(bb)$  (invariant mass)  
= Higgs mass

### Main backgrounds

$$e^+e^- \rightarrow \gamma Z \rightarrow \gamma qq$$

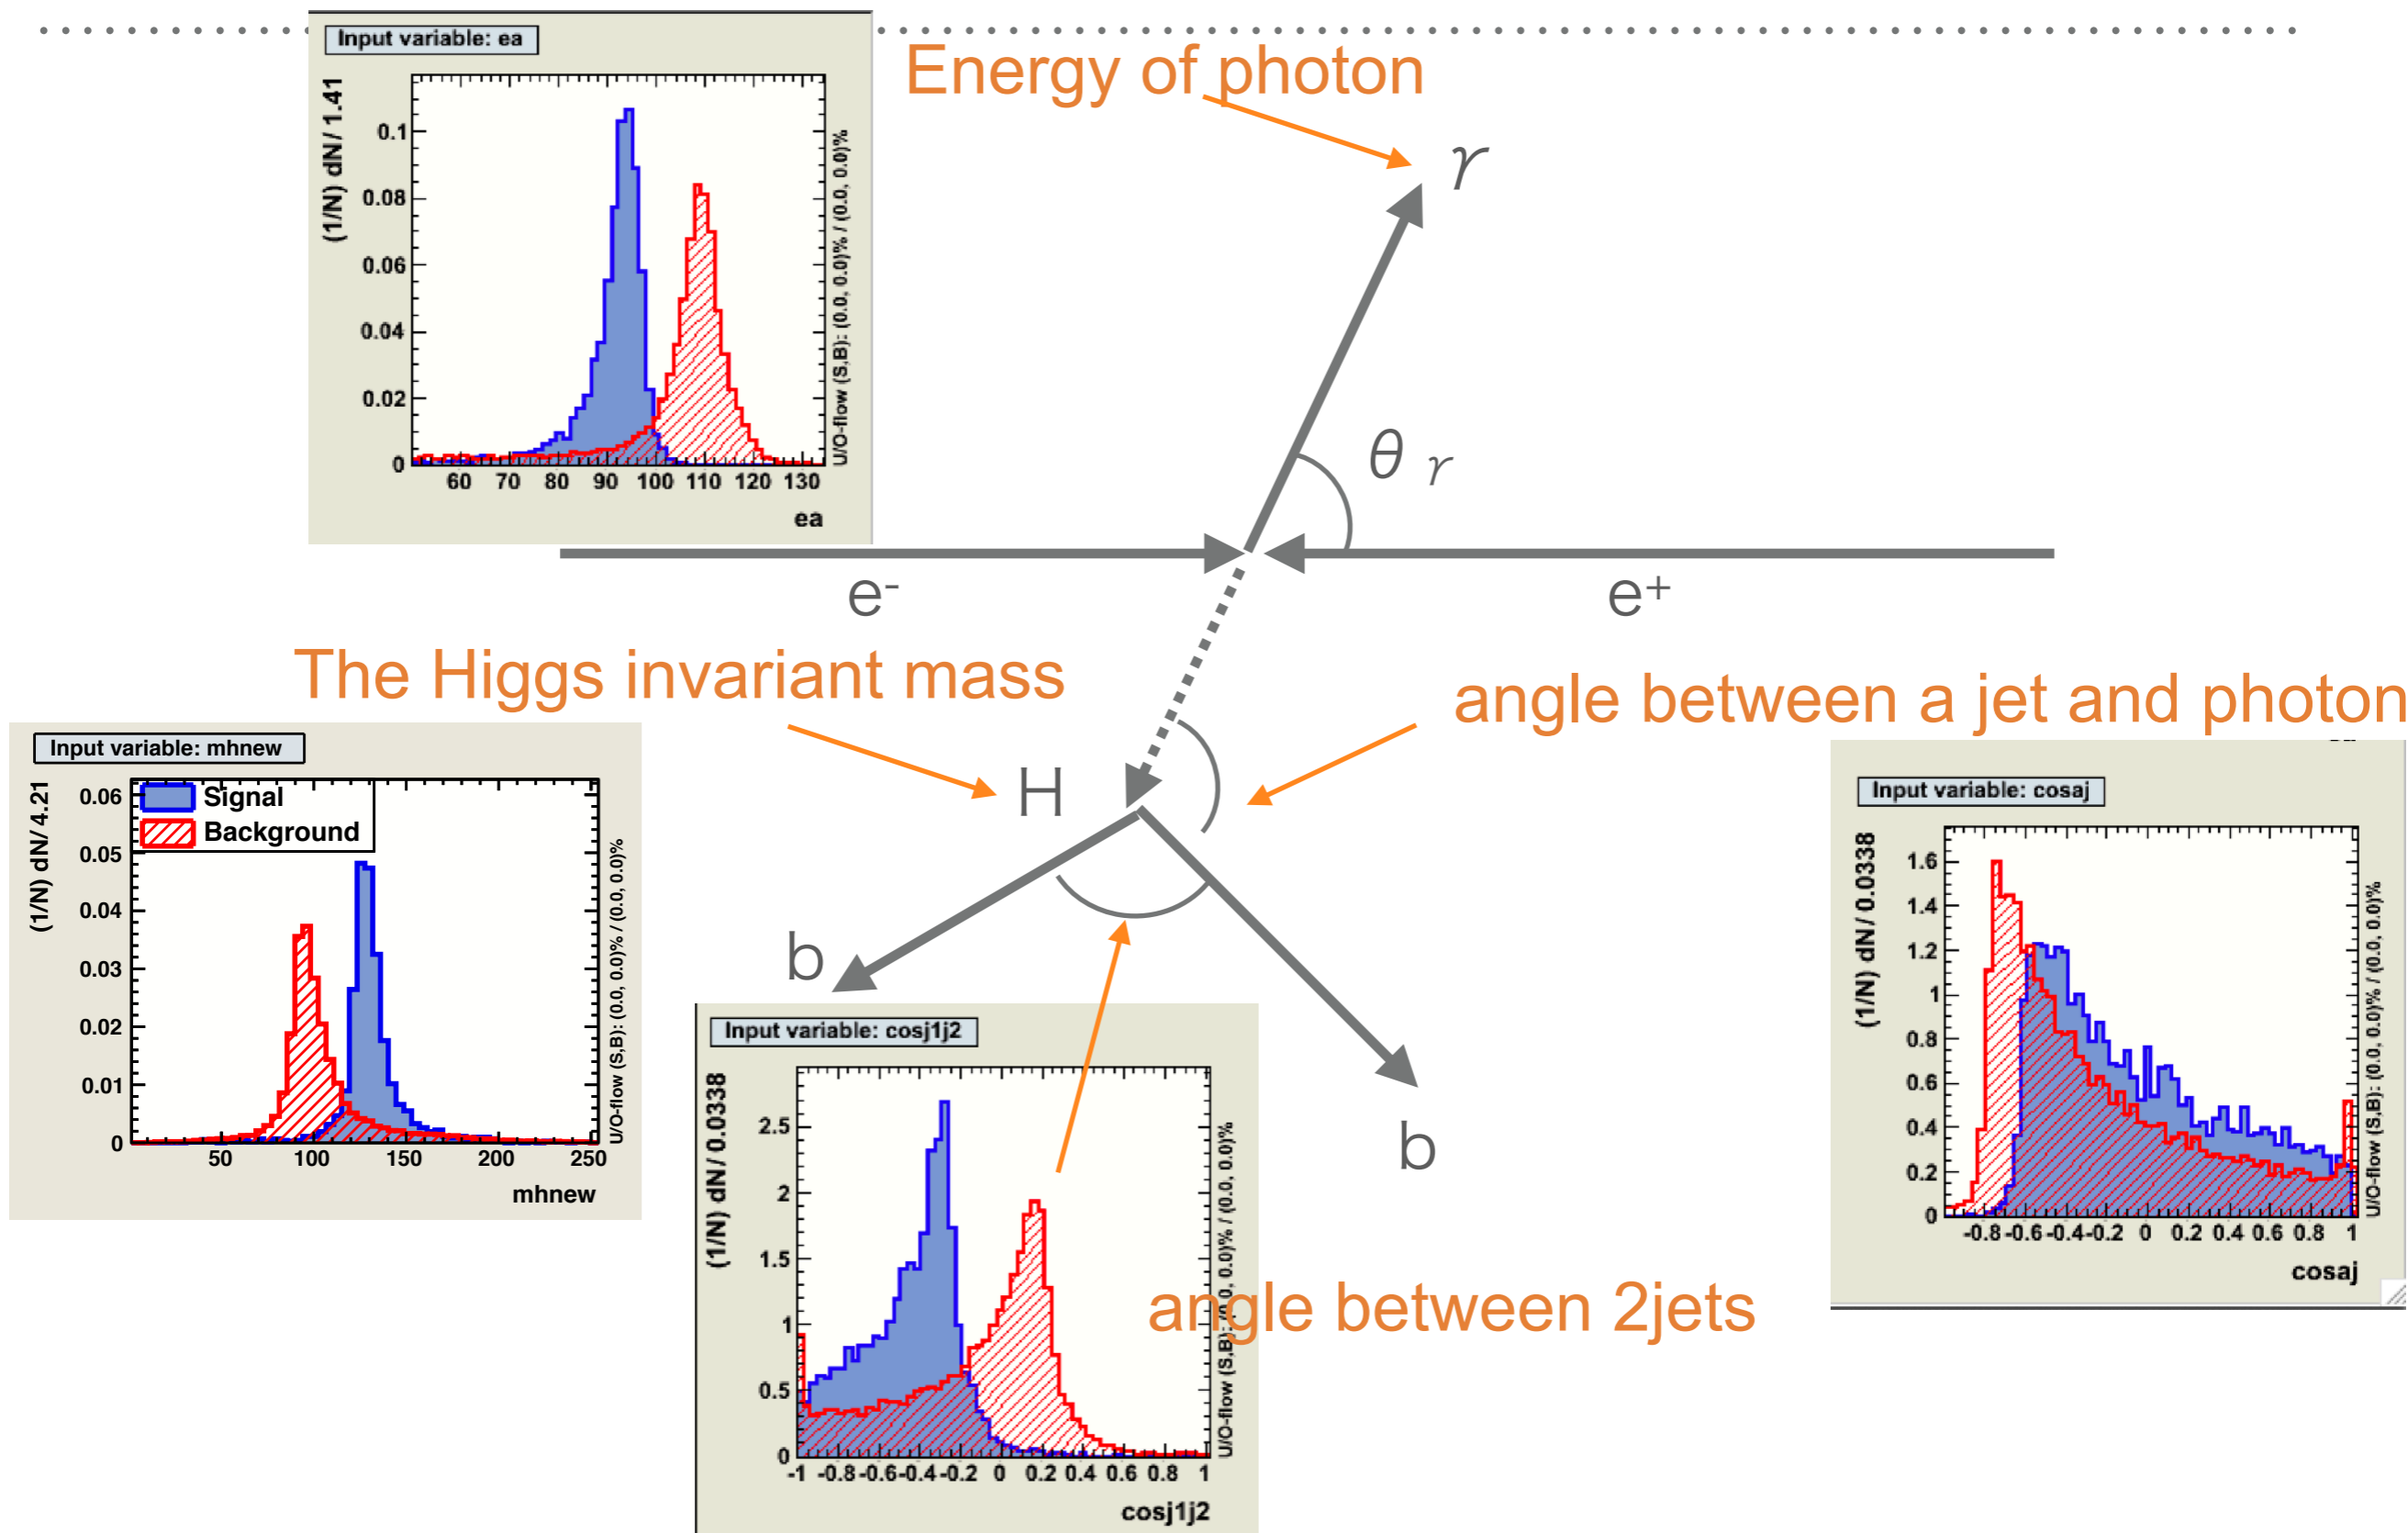

Cut 1: b likelihood  $1 > 0.77$

Cut 2: missing energy  $< 35$  GeV

# 5. Analysis - Input variables for MVA

## 5. Analysis - Reduction table

Left	total bg	Signal	Significance
Expected	$1.4 \times 10^8$	107	0.01
Pre selection	$2.9 \times 10^7$	100	0.02
b likelihood > 0.77	$2.2 \times 10^6$	90	0.06
$E_{\text{mis}} < 35$	$1.9 \times 10^6$	82	0.06
mvabdt > 0.025	19583	34	0.24
$-0.92 < \cos\theta_\gamma < 0.92$	12422	29	<b>0.26</b>

Right	total bg	Signal	Significance
Expected	$7.8 \times 10^7$	11.2	0.001
Pre selection	$2.3 \times 10^7$	10.3	0.002
b likelihood > 0.77	$1.5 \times 10^6$	9.4	0.008
$E_{\text{mis}} < 35$	$1.3 \times 10^6$	8.4	0.007
mvabdt > 0.025	$1.0 \times 10^4$	3.4	0.034
$-0.92 < \cos\theta_\gamma < 0.92$	$5.9 \times 10^3$	3.0	<b>0.039</b>

$$\text{significance} = \frac{N_s}{\sqrt{N_s + N_B}}$$

$N_s$ : # of signal

$N_B$ : # of bg

## 5. Analysis - Event selection1

Signal:  $e^+e^- \rightarrow \gamma h \rightarrow \gamma(WW^*) \rightarrow \gamma 2j l\nu$

one W decays hadronically (W1), and another decays leptonically(W2)

### Signal signatures

1. Isolated monochromatic photon with energy 93 GeV
2. 2 jets that originated from the hadronically decayed W

Cut1. # of charged particle in jets >3

3. the sum of four momenta of the 2 jets, the lepton and lepton neutrino is consistent with Higgs hypothesis,

Main backgrounds  $e^+e^- \rightarrow W^+W^-(\gamma)$

## 5. Analysis - Event selection2

Signal:  $e^+e^- \rightarrow \gamma h \rightarrow \gamma(WW^*) \rightarrow \gamma 2j l\nu$

one W decays hadronically (W1), and another decays leptonically (W2)

Signal signatures

- either one of the 2 jets or the lepton-neutrino systems has an invariant mass consistent with the on-shell W hypothesis

Cut2.  $|m_{w1}-80.4| < 10$  GeV or  $|m_{w2}-80.4| < 9.4$  GeV

5. there are no b-quark jets

Cut3. b likeliness < 0.77

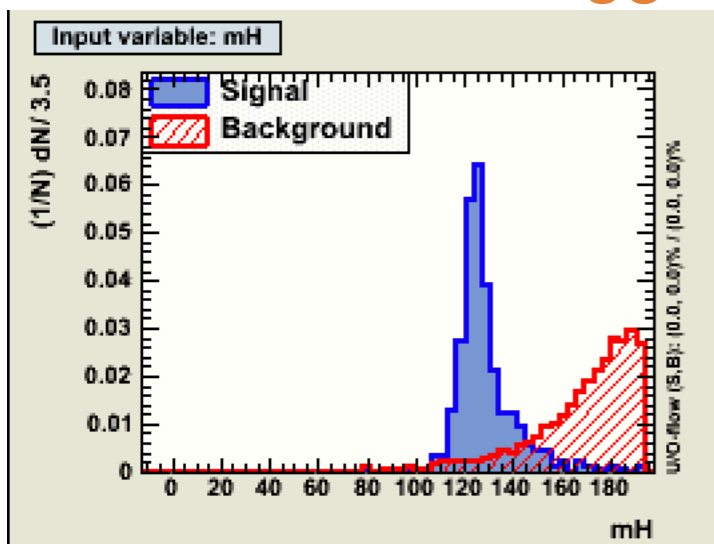

# 5. Analysis - Input variables for MVA

Energy of photon

The Higgs invariant mass

Mass of  $\gamma qq$

Missing Energy

# 5. Analysis - Reduction table and upper limit

Left	total bg	Signal	Significance
Expected	$1.4 \times 10^8$	18.0	0.003
Pre selection	$1.3 \times 10^7$	10.5	0.004
# of charged particle >3	$3.1 \times 10^5$	5.4	0.010
$ m_{w1}-80.4  < 10$ GeV or $ m_{w2}-80.4  < 9.4$ GeV	$1.9 \times 10^5$	3.7	0.009
b likelihood < 0.77	$1.8 \times 10^5$	3.7	0.009
$m_{vabdt} > 0.1$	41	1.0	0.16
$-0.93 < \cos\theta_\gamma < 0.93$	8	0.9	<b>0.31</b>
Right	total bg	Signal	Significance
Expected	$7.8 \times 10^7$	1.9	0.000
Pre selection	$1.2 \times 10^7$	2.0	0.000
# of charged particle >3	$8.6 \times 10^4$	1.5	0.002
$ m_{w1}-80.4  < 10$ GeV or $ m_{w2}-80.4  < 9.4$ GeV	$3.2 \times 10^4$	0.4	0.002
b likelihood < 0.77	$2.6 \times 10^5$	0.4	0.002

$-0.93 < \cos\theta_\gamma < 0.93$	5	0.1	<b>0.04</b>

## 5. Analysis - Uncertainty due to finite MC statistics

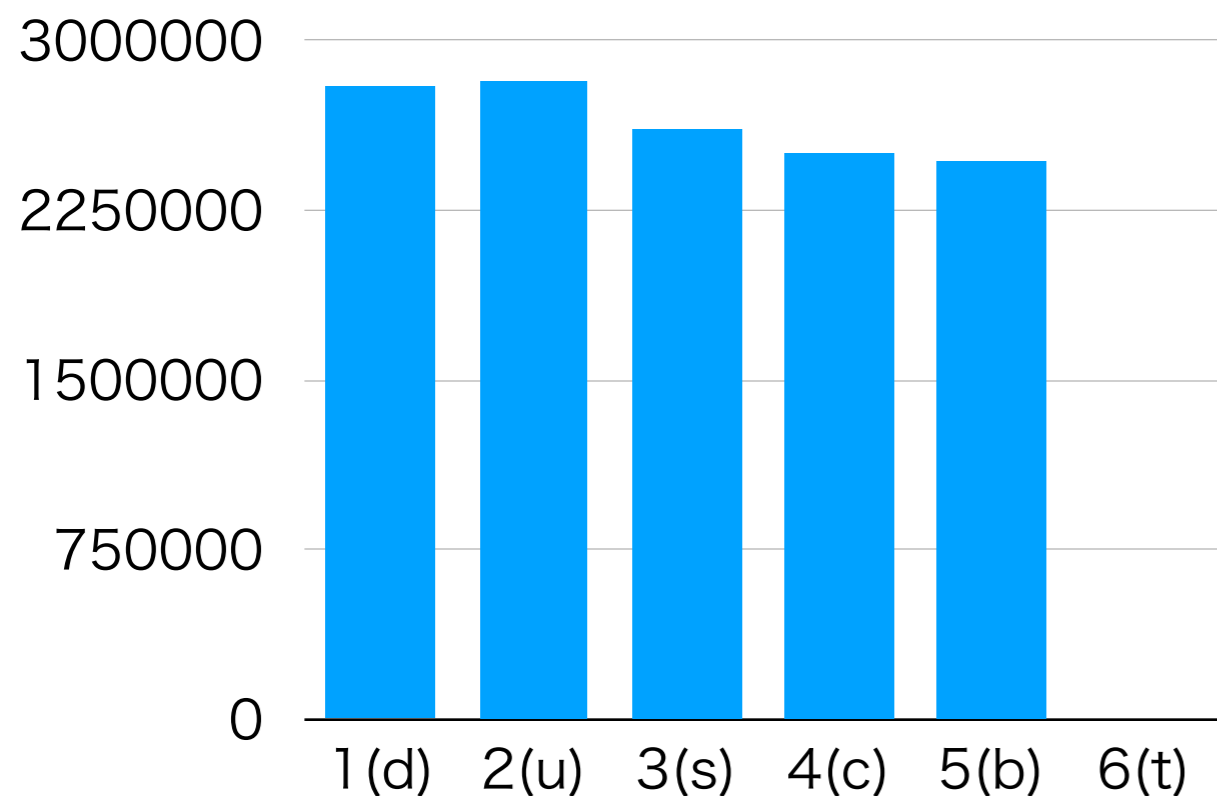

We conservatively re-estimated the numbers of remaining background events with high weights (= low statistics) and re-evaluated signal significance.

		total bg	Signal	Significance	95% C.L upper limit on $\sigma_{\gamma H}$ (fb)
h→bb Left	Nominal	12422	29	0.29	2.6
	Conservative	13488	29	0.25	2.7
h→bb Right	Nominal	5946	3	0.04	0.7
	Conservative	7204	3	0.04	0.8
h→WW* Left	Nominal	8	0.9	0.31	2.2
	Conservative	92	0.9	0.09	6.5
h→WW* Right	Nominal	5	0.1	0.01	0.7
	Conservative	21	0.1	0.02	1.2

# 5. Analysis - Uncertainty due to finite MC statistics

Is there any room to improve significance  
by improving flavor tagging?

Before cuts

After cuts

By flavor cut ( $b\text{-tag} > 0.77$ ), quarks other than b are cut off  
→ There is few room to improve significance

## 6. Combined result - Each polarization

95% C.L. upper limit  
(e<sup>-</sup>, e<sup>+</sup> = -100, +100)

$$\sigma_{\gamma H} = \sigma_{SM} + \frac{1.64}{\text{significance}} \sigma_{SM}$$

Left handed

H → bb

Significance = 0.26 for SM

H → WW (Semi-leptonic)

Significance = 0.31 for SM

Combined

Significance = 0.40 for SM

**$\sigma_{\gamma H^L} < 1.8 \text{ fb}$**  (95% C.L. upper limit)

Right handed

H → bb

Significance = 0.039 for SM

H → WW (Semi-leptonic)

Significance = 0.042 for SM

Combined

Significance = 0.06 for SM

**$\sigma_{\gamma H^R} < 0.5 \text{ fb}$**  (95% C.L. upper limit)

## 6. Combined result - conversion to $\zeta_{AZ}$

$$L_{\gamma H} = L_{SM} + \frac{\zeta_{AZ}}{v} A_{\mu\nu} Z^{\mu\nu} H + \frac{\zeta_A}{2v} A_{\mu\nu} A^{\mu\nu} H$$

Left handed **Combined** Significance = 0.40 for SM

$$5.1 > \frac{\sigma_{\gamma H}}{\sigma_{SM}} = 1 - 273\zeta_A - 201\zeta_{AZ} > 0 \quad \text{assume } \zeta_A = 0$$

$$-0.020 < \zeta_{AZ} < 0.005$$

Right handed **Combined** Significance = 0.06 for SM

$$28.3 > \frac{\sigma_{\gamma H}}{\sigma_{SM}} = 1 + 492\zeta_A - 311\zeta_{AZ} > 0 \quad \text{assume } \zeta_A = 0$$

$$-0.088 < \zeta_{AZ} < 0.0032$$

## 7. Summary

.....  
 We have performed a full simulation study of  $e^+e^- \rightarrow H\gamma$  at 250 GeV ILC, using ILD detector and full 1-loop SM amplitudes.

- signal significance and upper limit of  $\sigma\gamma H$  for SM at  $\sqrt{s}=250$  GeV,  $900 \text{ fb}^{-1}$

(Left handed)      Significance = 0.40 for SM

**$\sigma\gamma H < 1.8 \text{ fb}$**       (95% C.L upper limit)

(Right handed)      Significance = 0.06 for SM

**$\sigma\gamma H < 0.5 \text{ fb}$**       (95% C.L upper limit)

- Conversion to  $\zeta_{AZ}$

(Left handed)       $-0.020 < \zeta_{AZ} < 0.005$

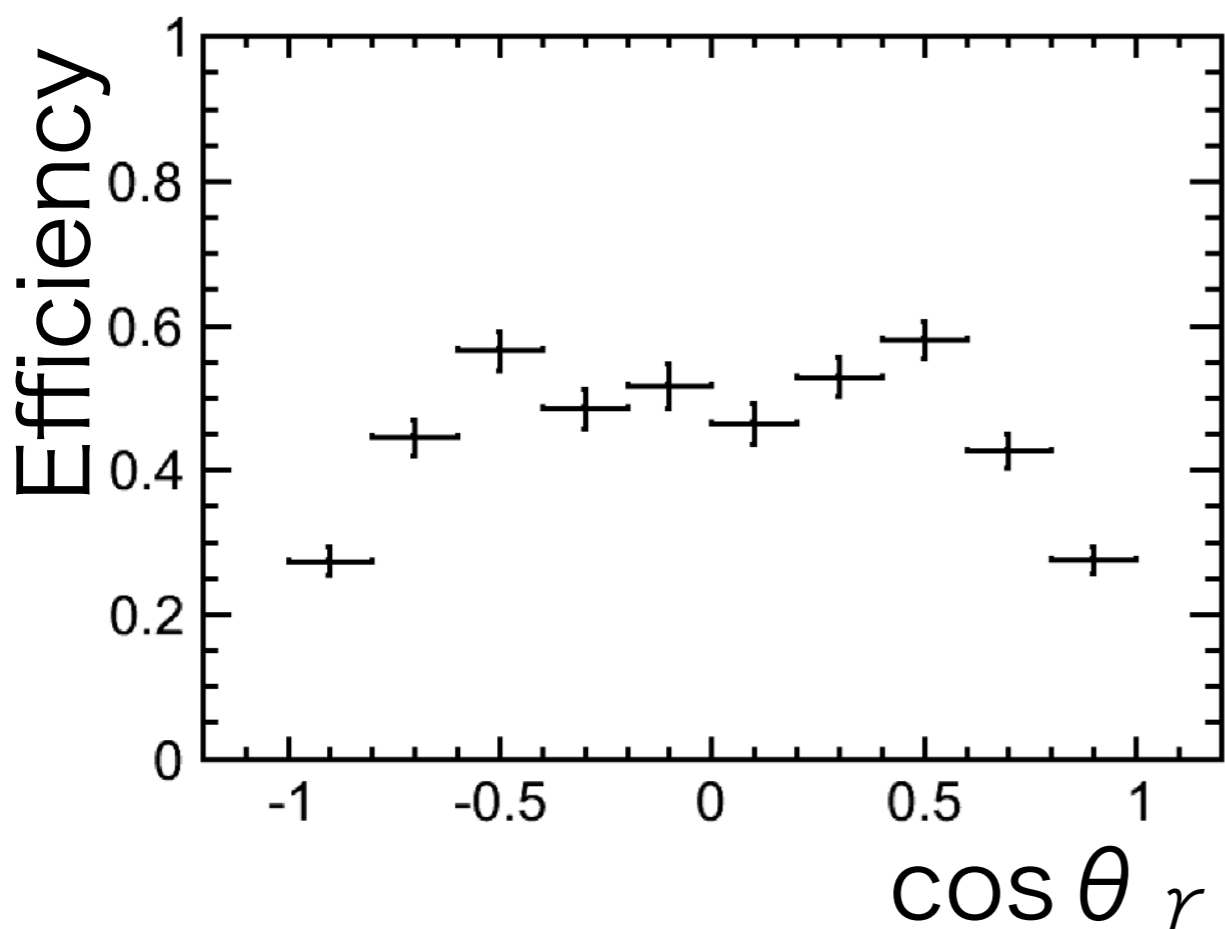

(Right handed)       $-0.088 < \zeta_{AZ} < 0.0032$

→ Discuss constraint on  $h\gamma Z$ , concrete models, electron Yukawa coupling

Back up

# $\cos\theta_\gamma$ Distribution(bb)

---

Take in  $\cos\theta_r$  in MVA

Take out  $\cos\theta_r$  from MVA

→ Check significant again

# $\cos\theta_\gamma$ Distribution( $WW^*$ sl)

---

Take in  $\cos\theta_\gamma$  in MVA

Take out  $\cos\theta_\gamma$  from MVA

→ Check significant again

## 4. Simulation framework - New Generator

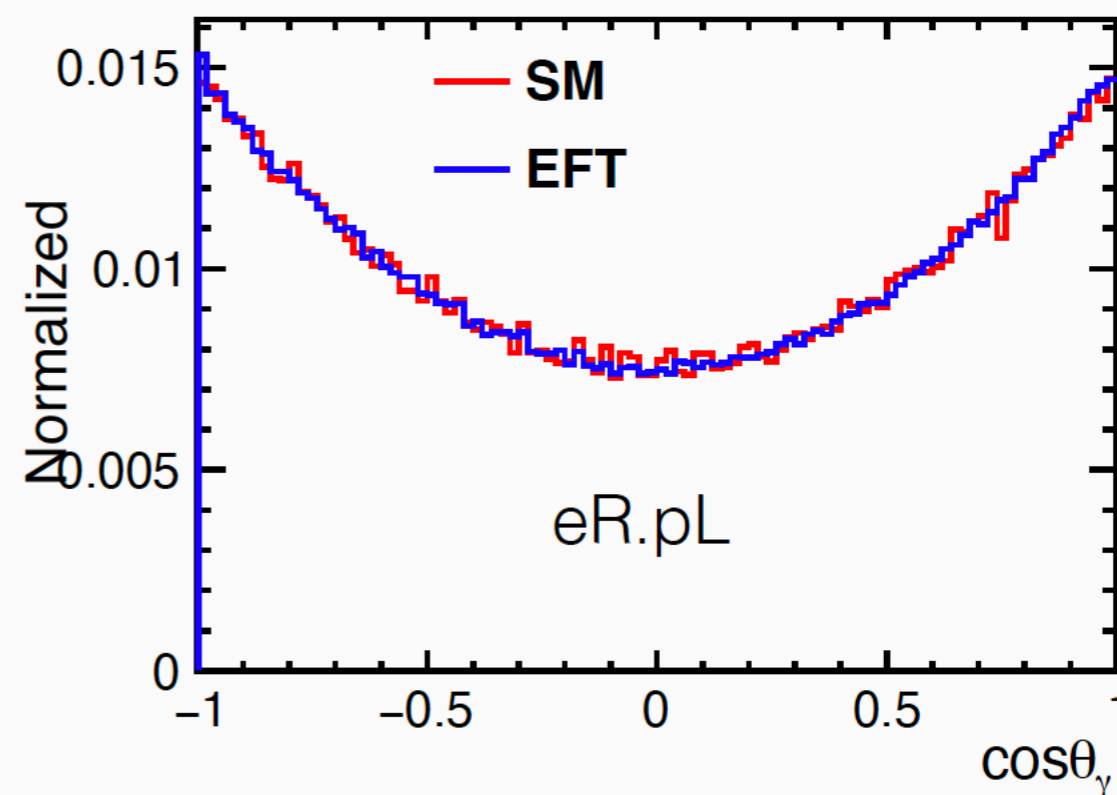

Old

Implemented with EFT coefficients matched to SM  $h \rightarrow \gamma\gamma / \gamma Z$  loop calculations  
(without SM loop)

New

Implemented with full SM 1-loop calculations

*angular distribution:*

## new event generator

- earlier generator was implemented with only EFT, without SM loop
- what's new is an implementation of parameterized SM differential cross section, by which impact of ISR on total cross section is also naturally taken into account

eL.pR
