

# **Schematic overview**

# Implementation

# Full simulation study at $\sqrt{s} = 250$ GeV

(MC2020 ILD mass production).

- $\checkmark$   $\sqrt{s} = 250$  GeV ideal for the Higgsstrahlung process.
- Considered backgrounds: Standard Model (SM) processes with 2 or 4 fermions in the final state.
- $\ge 2400$ k simulated events/SM Higgs decay mode.
- Polarized initial beams: 80% left (30% right) polarized electron (positron) beam.
- $\blacktriangleright$  2000 fb<sup>-1</sup> integrated luminosity.

## **Toy validation**

Draw toys from Multinomial ( $N_{data}$  fixed). The histogram stores the  $H \rightarrow b\bar{b}$  branching ratio at the fit minimum. The distribution can be described by a Gaussian with mean and varaince obtained from the fit on the expected event counts.

# A combined fit to the Higgs branching ratios at ILD

Jonas Kunath, on behalf of the ILD concept group

Laboratoire Leprince-Ringuet, École Polytechnique

## 2. Sample creation 1. Event selection Events without the part identified as from the recoiling Z boson. Create bins inspired by the expected decays, with established tools. ► E.g. bb\_tight: No Isolated leptons or photons in event. Require LCFIPlus btag 1 > 0.8 for event clustered into two jets. ► Final state radiation: Add 3. Branching ratio (BR) fit photons with BRs from minimization of $\vec{S} = M \cdot \vec{B} = \vec{f}(\vec{B})$ through MINUIT/iminuit. $\cos\theta_{l\gamma} > 0.99.$ Selection cuts shown on $\blacktriangleright \vec{S}$ : The signal counts per category (S = data - bkg). the right. ► M: The probability matrix from simulations per bkg and decay mode. $\blacktriangleright \vec{B}$ : The target: branching ratios. Use e.g. the SM BRs as fit starting 2f leptonic 4f leptonic 4f semileptonic other higgs values. Cost function: Multinomial log-likelihood. $-\ln \mathcal{L} = -N_{\text{data}} \sum_{i} S_{i} \ln \left( \sum_{j} M_{ij} B_{j} \right).$ References -0.75 -0.50 -0.25 0.00 0.25 0.50 0.75 COSθ7 0 - 0.75 - 0.50 - 0.25 0.00 0.25 0.50 0. $COS<math>\theta_{miss}$ ► The International Linear Collider: Technical Design Report (2013). Solely information from recoiling Z boson is used: Independent of Higgs decay. Currently only with  $Z \to \mu^+ \mu^-$ ,  $Z \to e^+ e^-$ Higgsstrahlung events as signal channels.

- Golden channels due to recoil mass method,  $M_{\rm recoil}^2 = s + M_Z^2 - 2\sqrt{s} \cdot E_Z.$
- IsolatedLeptonTagger: Lepton pair with same type and opposite charge.
- Extraction of major branching single analysis.  $\rightarrow$  Full statistic correlation matrix.
- $\blacktriangleright$  Independent of  $\sigma_{ZH}$  and  $\sigma_{VV-1}$
- Can automatically adapt to BR drastically different from SM.

	SM BR $\sigma_{ m stat}$
$H \rightarrow bb$	57.72 0.86
$H \to WW$	21.76 1.34
$H \to gg$	8.55 1.25
$H \to \tau \tau$	6.20 1.30
$H \to cc$	2.72 0.55
$H \to ZZ$	2.62 1.93
$H \to \gamma \gamma$	0.24 0.17
$H \to Z\gamma$	0.17 0.35
$H \to \mu \mu$	0.03 0.14
