1. Motivation

Find new physics via $h\gamma\gamma$ and $h\gamma Z$ couplings

$h\gamma Z$ coupling in the Standard Model (SM) is a loop induced coupling.
 → We expect BSM amplitude can be larger than SM amplitude.

We are the first to study the $h\gamma Z$ coupling bond using $e^+e^- \rightarrow h\gamma$

Any deviation of the **coupling constants from SM** signals new physics.

In this talk, we will report the simulation results of **cross-section at ILC** and the constraints such as model independent and **$h\gamma Z$ coupling constant**.

2. Theoretical framework for our analysis

SM one-loop predictions

※For unpolarized beam

SM cross sections by one loop calculation: $\sqrt{s} = 250 \text{ GeV}$

$$\sigma_{\text{SM}}^{\text{L}} = 0.35 \text{ fb for } (-100\%, +100\%)$$

$$\sigma_{\text{SM}}^{\text{R}} = 0.016 \text{ fb for } (+100\%, -100\%)$$

$$\sigma_{\text{SM}} = \mathbf{0.20 \text{ fb}} \text{ for } (-80\%, +30\%)$$

This analysis is very challenging.

3. Experimental Method

The effective field theory (EFT) Lagrangian (model-independent)

$$L_{\gamma H} = L_{SM} + \overset{\text{effective } h\gamma Z \text{ coupling}}{\frac{\zeta_{AZ}}{v}} A_{\mu\nu} Z^{\mu\nu} H + \overset{\text{effective } h\gamma\gamma \text{ coupling}}{\frac{\zeta_A}{2v}} A_{\mu\nu} A^{\mu\nu} H$$

$A_{\mu\nu}, Z_{\mu\nu}$: field strength tensors v : vacuum expectation value

cross section of $e^+e^- \rightarrow \gamma H$

Phys.Rev. D94 (2016) 095015

$$\frac{\sigma_{\gamma H}}{\sigma_{SM}} = 1 - 273\zeta_A - 201\zeta_{AZ} \quad (\text{eLpR})$$

$$\frac{\sigma_{\gamma H}}{\sigma_{SM}} = 1 + 492\zeta_A - 311\zeta_{AZ} \quad (\text{eRpL})$$

Since ζ_A is already constrained by measurement of $h \rightarrow \gamma\gamma$ branching ratio at LHC, we can extract ζ_{AZ} parameter by just measuring cross section for a single beam polarization.

4. Simulation framework

- $\sqrt{s}=250$ GeV
Integrated Luminosity: 2000 fb⁻¹
(900 fb⁻¹ each for Left / Right handed pol.)
- background : 2f,4f (DBD sample)
- ISR and Beamstrahlung effects are included
- **ILD full simulation (Mokka)**
- Geant4 based, realistic detailed detector model
- Full reconstruction chain from detector signals to 4-vectors
(iLCSoft v01-16-02/ MarlinReco, PandoraPFA, LCFI+, Isolated photon finder, jet clustering)

$h \rightarrow bb$

$h \rightarrow WW^*$
fully hadronic

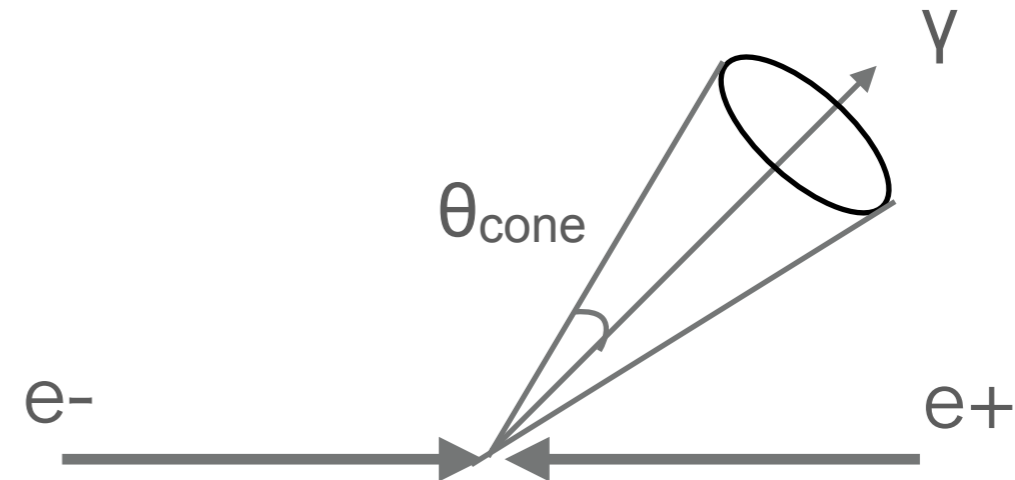

$h \rightarrow WW^*$
semi leptonic

5. Pre-Event selection

Isolated photon

- Photon ID
- $E_\gamma > 50 \text{ GeV}$

※ The split photon clusters within a small cone are recovered
➤ $(\cos\theta_{\text{cone}}=0.998)$

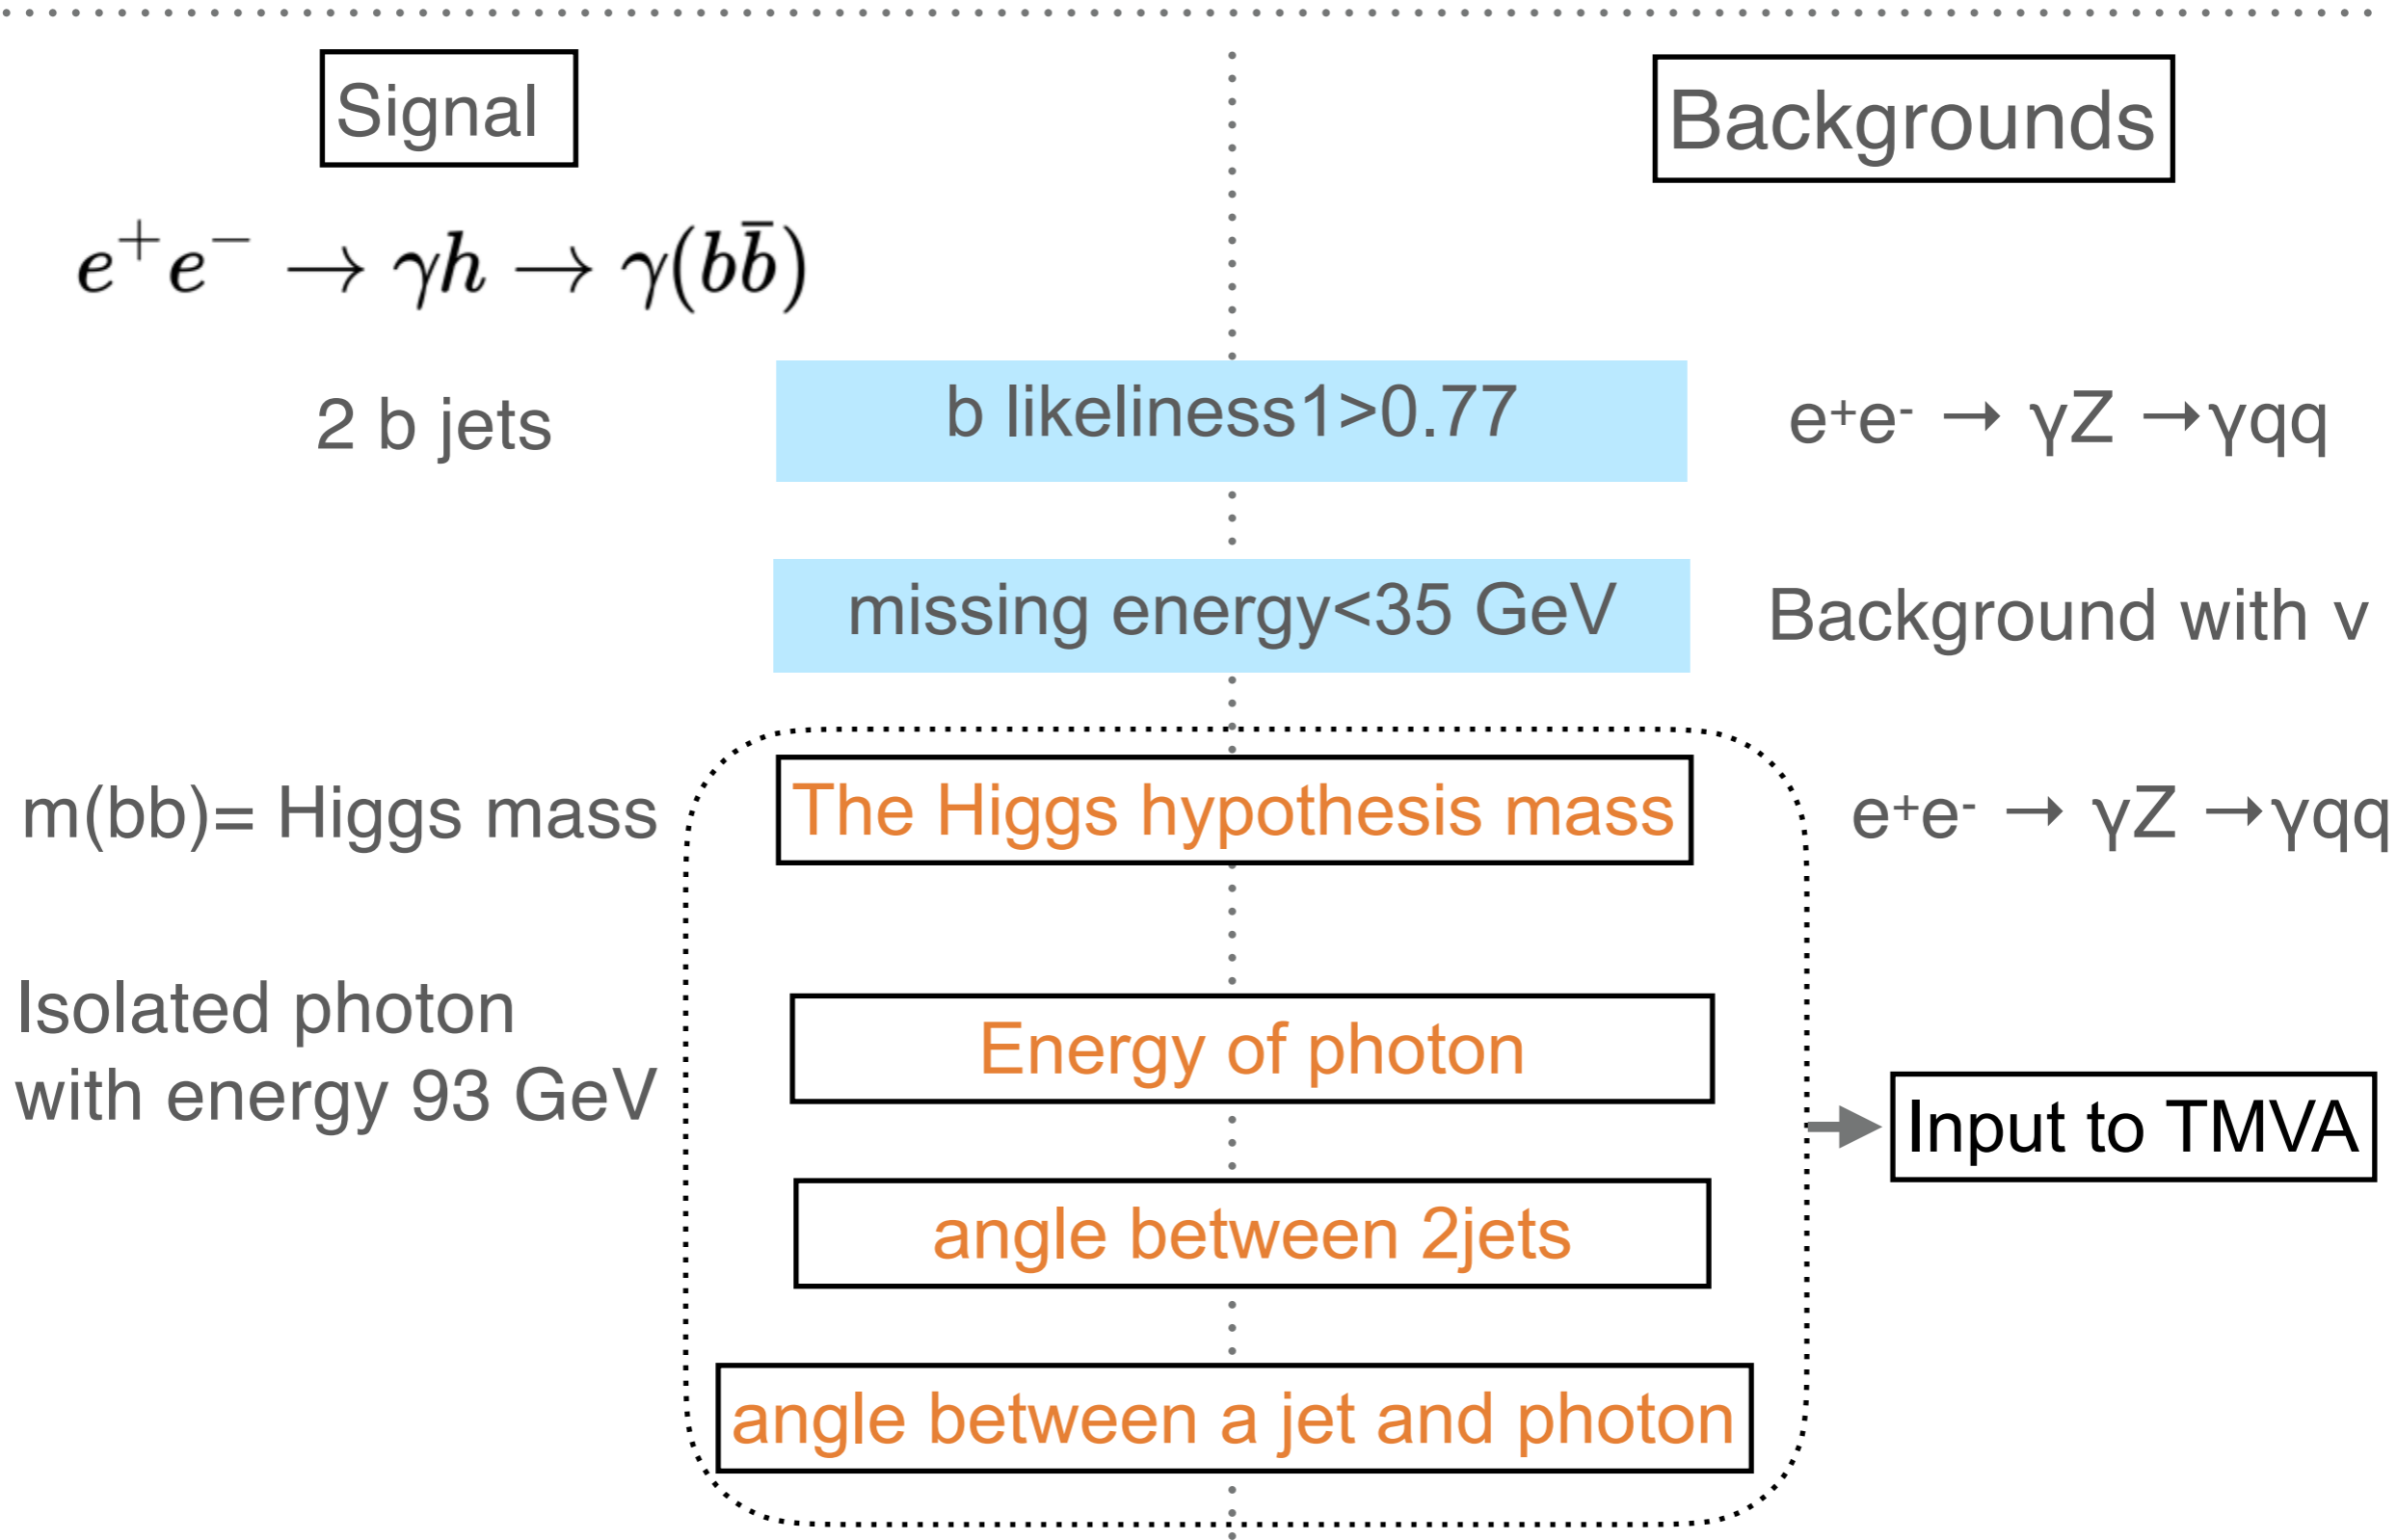

Remaining particles other than photon

- Jet clustering (Durham)
- Flavor tagged (LCFI+)

For $h \rightarrow WW^*$ semi-leptonic : number of decay w to qq=1

For $h \rightarrow WW^*$ fully-hadronic : number of decay w to qq=2

5. Event selection

5. Signal Significance

$$\text{significance} = \frac{N_s}{\sqrt{N_s + N_B}}$$

N_s : # of signal
 N_B : # of bg

Left handed

Combined

Significance = 0.41 for SM

$$5.0 > \frac{\sigma_{\gamma H}}{\sigma_{SM}} = 1 - 273\zeta_A - 201\zeta_{AZ} > 0 \quad \text{assume } \zeta_A = 0$$

$$-0.020 < \zeta_{AZ} < 0.005$$

Right handed

Combined

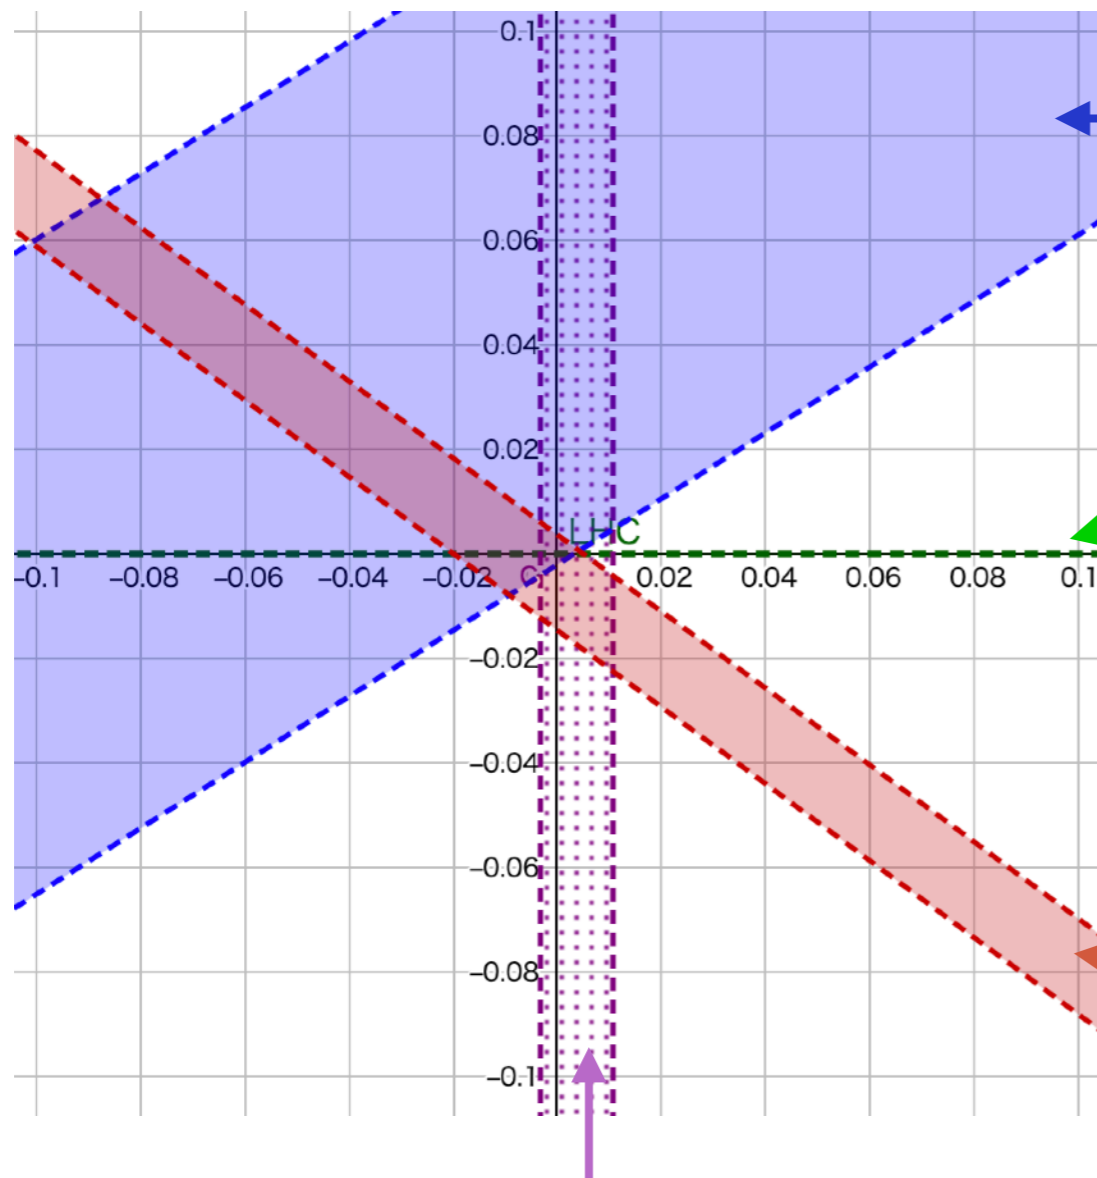

Significance = 0.027 for SM

$$61.7 > \frac{\sigma_{\gamma H}}{\sigma_{SM}} = 1 + 492\zeta_A - 311\zeta_{AZ} > 0 \quad \text{assume } \zeta_A = 0$$

$$-0.195 < \zeta_{AZ} < 0.0032$$

8. Comparison with LHC

$$L_{\gamma H} = L_{\text{SM}} + \frac{\zeta_{AZ}}{v} A_{\mu\nu} Z^{\mu\nu} H + \frac{\zeta_A}{2v} A_{\mu\nu} A^{\mu\nu} H$$

Right handed limit

$$61.7 > 1 + 492\zeta_A - 311\zeta_{AZ} > 0$$

HL-LHC limit ($h \rightarrow \gamma\gamma$)

$$-0.04 < \delta\Gamma(h \rightarrow \gamma\gamma) = 526\zeta_A < 0.04$$

ATL-PHYS-PUB-2018-054

<https://arxiv.org/abs/1708.09079>

Left handed limit

$$5.0 > 1 - 273\zeta_A - 201\zeta_{AZ} > 0$$

LHC limit ($h \rightarrow \gamma Z$)

$$0 < 1 + \delta\Gamma(h \rightarrow Z\gamma) = 290\zeta_{AZ} < 4.1$$

CMS-PAS-HIG-19-014

8. Constraint on concrete models

$$\frac{\sigma_{h\gamma^L}}{\sigma_{SM}^L} < 5.0$$

(95% C.L upper limit)

$$\frac{\sigma_{h\gamma^R}}{\sigma_{SM}^R} < 61.7$$

Inert Triplet Model

Kanemura, et al, arXiv:1808.10268

This is the unpolarization plot →

I asked theorist to provide new version of HCOUP, which can calculate cross-section to prepare similar plot for each polarization.

$$\Delta R(e^+e^- \rightarrow h\gamma) = \frac{\sigma(e^+e^- \rightarrow h\gamma)}{\sigma_{SM}(e^+e^- \rightarrow h\gamma)} - 1$$

Kanemura, et al, arXiv:1808.10268

8. Constraint on electron Yukawa coupling

The the differential cross section is calculated as :

$$\frac{d\sigma_{LL}}{d\cos\theta} = \frac{d\sigma_{RR}}{d\cos\theta} =$$

$$\frac{1}{2s\beta_e} 2e^2 \left(\frac{m_e}{v}\right)^2 D_t D_u s^2 \left[\left(1 - \frac{m_h^2}{s}\right)^2 tu D_t D_u + 2 \left(\frac{m_h^2}{s}\right) \right] \frac{\bar{\beta}}{16\pi} \quad \frac{1}{q^2 - m_e^2} = D_t, \frac{1}{r^2 - m_e^2} = D_u$$

The cross-section is small in the small $|\cos\theta|$ region.

→ It is very difficult to capture the photon and h in this region because it is the pipeline of the detector.

8. $\cos\theta$ Integration

95% C.L upper limit

$(e^-, e^+) = (-80, +30)$, $(-80, +30)$

$$\sigma_{\text{hy}}^{\text{L}} < 1.0 \text{ fb} \quad \sigma_{\text{hy}}^{\text{R}} < 0.6 \text{ fb}$$

$|\cos\theta| < 0.92$

$$\sigma_{\text{hy}}^{\text{L}} (\text{Electron-Yukawa}) = 3.6 \times 10^{-7} \text{ [fb]}$$

$$y_e / y_{e(\text{SM})} < 1.6 \times 10^3$$

$$\sigma_{\gamma H} = \sigma_{SM} + \frac{1.64}{\text{significance}} \sigma_{SM}$$

$$\sigma_{\text{hy}}^{\text{R}} (\text{Electron-Yukawa}) = 5.9 \times 10^{-7} \text{ [fb]}$$

$$y_e / y_{e(\text{SM})} < 1.0 \times 10^3$$

9. Summary

.....

We have performed a full simulation study of $e^+e^- \rightarrow h\gamma$ at 250 GeV ILC, using ILD detector and full 1-loop SM amplitudes.

Upper limit of $e^+e^- \rightarrow \gamma h$ at $\sqrt{s}=250$ GeV, 900 fb^{-1}

(Left handed) $\sigma_{h\gamma}^L < 1.0 \text{ fb}$ (95% C.L upper limit)

(Right handed) $\sigma_{h\gamma}^R < 0.6 \text{ fb}$ (95% C.L upper limit)

Constraint on ζ_{AZ} coupling

(Left handed) $-0.020 < \zeta_{AZ} < 0.005$

(Right handed) $-0.195 < \zeta_{AZ} < 0.0032$

Constraint on electron-Yukawa coupling

$\sigma_{h\gamma}^L (\text{Electron-Yukawa}) = 3.6 \times 10^{-7} \text{ [fb]}$ $\sigma_{h\gamma}^R (\text{Electron-Yukawa}) = 5.9 \times 10^{-7} \text{ [fb]}$
