Updates on the Megatile Prototypes

The JGU team:

Volker Büscher, Phi Chau, Karl-Heinz Geib, Antoine Laudrain, Lucia Masetti, Marisol Robles, Sebastian Ritter, <u>Anna Rosmanitz</u>, Christian Schmitt

Including the PRISMA detector lab team:

Peter Bernhard, Anastasia Mpoukouvalas, Quirin Weitzel

AHCAL main meeting

08.12.2021

Bundesministerium für Bildung und Forschung

Megatile Concept

- Large 36x36 cm² scintillator tile
- Cut trenches at 30°
- Fill trenches with glue + TiO₂ mixture
- Dimple: Same as for single tiles

Megatile Concept

- Covered with reflective foil
- Air gap needs to be well controlled for total reflection
 - Too large gap produces cross talk
 - Glue foil to scintillator along trenches
- Edges sprayed with varnish to improve light tightness and reflectivity of edge cells

Megatile Development

- Project started in 2017
- Already 10 prototypes built with steady improvement
- Continuously tested in cosmic test stand in Mainz
- 5 test beams at DESY II

• Latest TB in comination with KLAUS HBU

Ageing Effects

- Light yield observed over a long time period
- Small decrease of <~5%/year
- Cause still under investigation
- Megatiles have to be stored in the dark

Light Yield (MT 10, Varnished)

- High light yield in center with mean of 35.2 p.e./MIP
- With varnish: LY in edge channels improved
- Uniformity map: For each quadrant, plot LY/<LY in central channels>

See talk by Antoine at last CALICE Collaboration Meeting

• Still optimising varnishing procedure

Anna Rosmanitz

Light Yield (MT 10, 2 Foils, Varnished)

- With foils glued: LY even higher
- Mean LY in center: 39.8 p.e./MIP
- Results still very preliminary

Ratio to center cells (by quadrant) 1.2 0.752 0.885 0.897 0.917 0.954 0.946 0.868 0.818 0.856 0.941 0.833 0.781 0.873 0.802 1 072 1 016 1 0 2 2 0.958 0.700 1.1 1.019 0.938 0.896 1.104 1.093 1.132 0.967 0.916 0.9 н 0.850 1.074 1.034 1.101 1.084 0.984 0.868 1 011 1 025 G 0.843 1.025 0.762 1.037 1.059 1.060 0.974 0.838 0.8 F 1.002 0.845 0.835 1 042 0 741 0.7 Е 0.875 0.842 D 0.850 0.890 0.6 С 0.886 0 820 1 060 1 0 3 2 1 013 1 005 05 В 0.793 0.752 0.997 1.033 0.940 0.971 0.998 0.691 А 0.866 0.910 0.933 0.873 0.831 0.865 0.843 0.748 0.7190.884 0.863 04А В Е Н .1 Κ L

MIP Intercalibration Problem

- MT 10 tested in test beam in September 2021
- LY too high for eletronics settings now
- MIP peak ends up in HG-LG intercalibration region
- Fit with higher uncertainty; improvement ongoing
- For next test beams: adjust electronics settings

Cross Talk Measurement

1. Central channel of MT defined by coincidence in single tile layers

Cross Talk Measurement

Anna Rosmanitz

Cross Talk Measurement

- 1. Central channel of MT defined by coincidence in single tile layers
- 2. P.e. cut on central tile
- 3. CT = pe neighbour channel / p.e. central channel

Details Cross Talk Measurement

- With August 2020 TB data
- Trigger treshold lowered as far as possile
 - CT can be calculated more exactly (not only as upper limit) hit energies

- Exactly 1 hit in each single tile layer
- Hit energy in single tile layer >0.7 mip
- Energy in neighbour < 0.7 mip
- Energy in central > 0.5 mip

Cross Talk Results

- Uniform cross talk < 3%
- Mean cross talk of 0.016

Cross Talk for MT 7

Anna Rosmanitz

Conclusion and Outlook

- Optical stability, no unexpected ageing with proper storage
 - Long term monitoring ongoing
- Foil gluing process and varnishing successful
 - Optimisation ongoing
- Now: need to adapt electronics settings to high LY
 - Improvements for fits ongoing
- Cross talk <3%
 - Under control due to foil gluing onto the Megatile
 - Use time and telesope data
- Investigation of trench region with telesope data

Thank you for your attention!
