Updates on $SS\bar{b}$ Analysis

Yuichi Okugawa
Apr 8th, 2022

ISR Suppression

ISR Suppression

- ISR effectively takes away the energy from the collision energy.
- Such phenomenon will distort the collinearity between two LPFOs. One can extract observed
 - Angle between LPFOs
 - Can jet angle do the job?
 - Visible total energy

ISR Suppression

ISR Suppression

- ISR effectively takes away the energy from the collision energy.
- Such phenomenon will distort the collinearity between two LPFOs. One can extract observed
 - Angle between LPFOs
 - Can jet angle do the job?
 - Visible total energy

ISR Suppression

Signal Definition

- SSbar back-to-back

$$0.95 < \cos \theta_{s\bar{s}}$$

- Total Energy

$$220 < E_s + E_{\bar{s}}$$

Reco ISR Removal

- LPFO back-to-back

$$0.95 < \cos \theta_{jets}$$

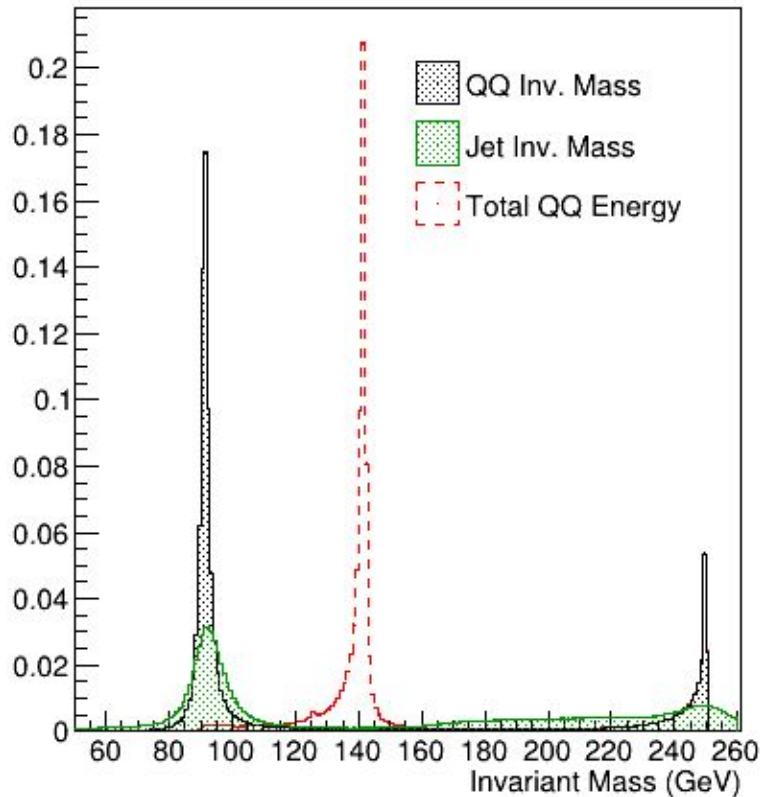

- Total Energy

$$220 < E_{vis}$$

Jet Energy

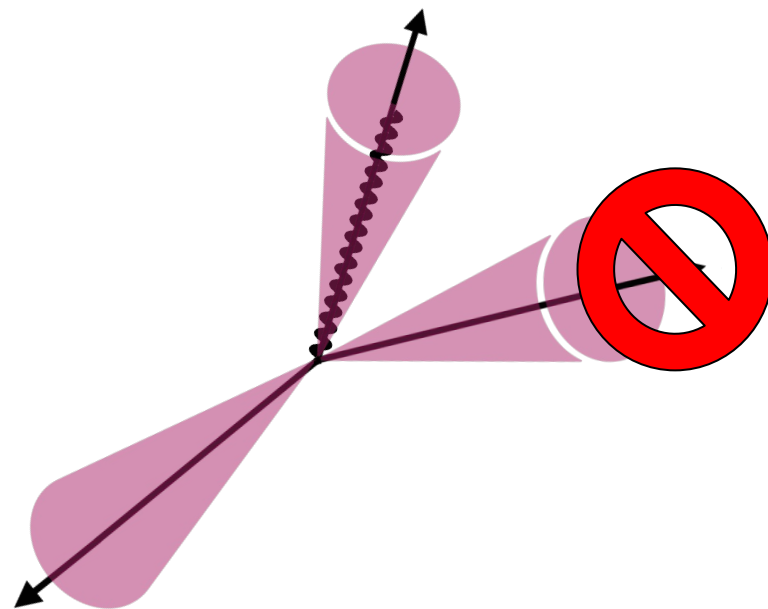

ISR Suppression

Jet Energy

ISR Suppression

Jet Energy

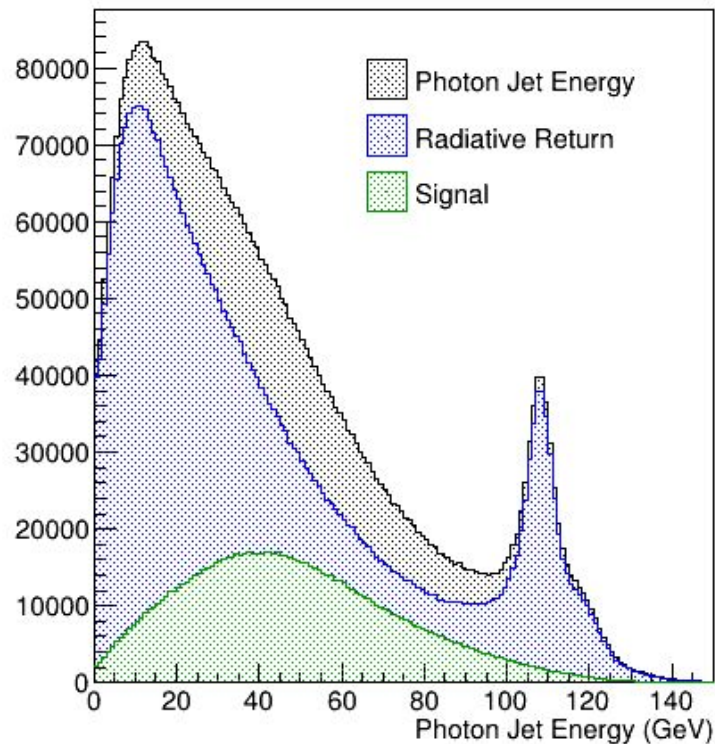

ISR Suppression

Neutral Jet Energy

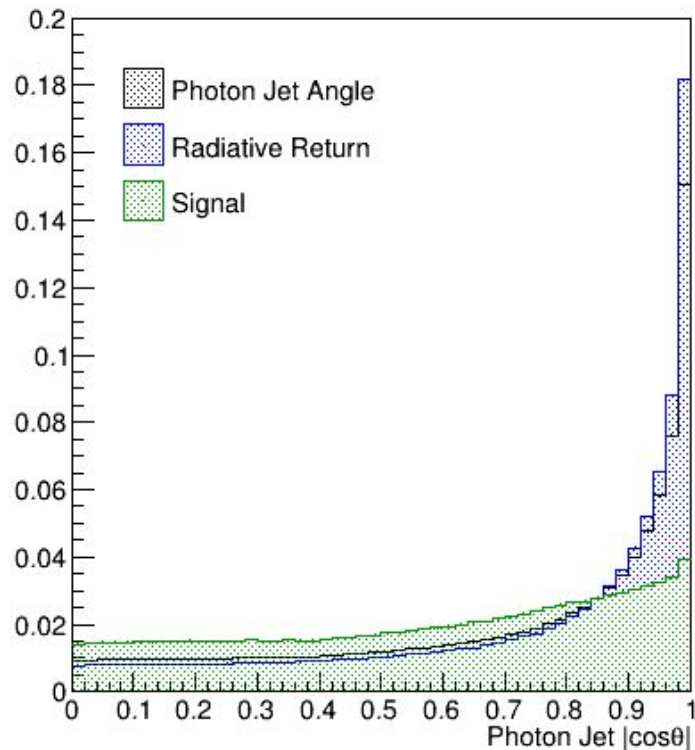

- Identify neutral pfos in a jet
 - `pfo->getType() == 22 || pfo->getType() == 2112`
- Add neutral pfo energy
 - Must be dominant compared to its total jet energy?
 - $E_{\text{neutral}} / E_{\text{Jet}}$
- Calculate neutral jet direction
 - cos theta
 - Does it go into beam pipe?

ISR Suppression

Neutral Jet E

Neutral Jet $|\cos\theta|$ (norm)

Summary

- ISR analysis was performed
- Based on Adrian's method, this still works with ssbar
 - Neutral jet energy
 - Neutral jet polar angle
- Can also implement 'Isolated Photon Finder Processor' to identify ISR photon -> eliminate from PFOs.

Backup

SSbar Analysis

SSbar Process

$$e^+e^- \rightarrow s\bar{s}$$

Analysis Steps

- Reconstruct SSbar process using generator information
 - Summer 2021
 - PID was performed by checking with the Generator Information.
 - Done to **explore the maximum efficiency** that can be achieved by this analysis.
 - Understanding the characteristics of the process itself.
- Reconstruct SSbar process using dE/dx distance PID
 - Fall 2021 - Winter 2022
 - PID was performed using **dE/dx distance information**.
 - Still use **Gen Info for Signal Selection**
 - Tight selection was applied to **achieve high purity**.
- Analysis Refinement
 - Winter 2022
 - Counter migration
 - Increase selection efficiencies.
 - Start of use **Reco Info for ISR removal**.

SSbar Reconstruction

Reconstruction Steps

LPFO Selection

Charge Check

Momentum Check

TPC Hit Check

IP Check

dE/dx Minimum Check

SPFO Check

Gen Signal Selection

- SSbar back-to-back

$$0.95 < \cos \theta_{S\bar{S}}$$

- Total Energy

$$120 < E_{S,\bar{S}} < 127 \text{ GeV}$$

Leading PFO

Momentum Check

TPC Hit Check

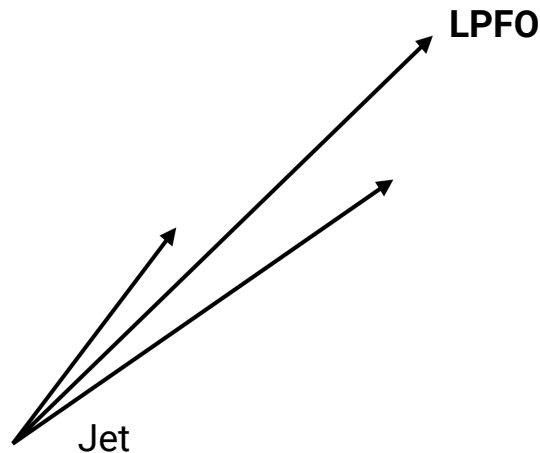

IP Check

dE/dx Minimum Check

SPFO Check

Leading PFO (LPFO)

- Particle with *highest* momentum within a Jet.
- $S\bar{S}$ typically disintegrate into a pair of energetic kaons.
- We choose LPFO among **charged PFOs** inside a jet.

SPFO Check

Secondary PFO (SPFO) Check

- Find SPFO such that:
 - Charged Kaon
 - Charge must be opposite to LPFO Kaon
(same sign does not create confusion)
 - Must have least 10 GeV momentum
- If there is such SPFO -> veto

Results II

After SPFO Removal

After SPFO Removal

What can we do?

Efficiency Refinement

- Change in Signal Selection
 - Back-to-Back: $0.95 < \cos \theta_{s\bar{s}}$
 - Total Energy: $120 < E_{s,\bar{s}} < 127 \text{ GeV}$
- Consider K^*

Other Possible Leading Ks

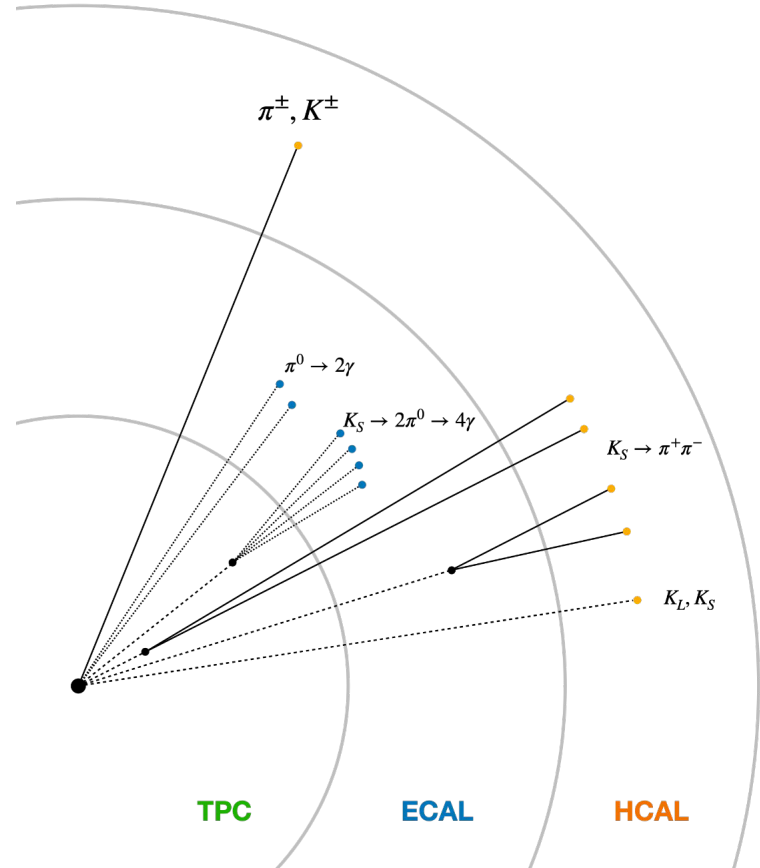

K^*

Why Migration?

Summary & Prospects

Summary & Prospects

Summary

- SSbar reconstruction was performed, using dE/dx PID.
 - Kaon identification
- Purity up to 96% was achieved with current selection.
- Suffers significantly from the efficiency loss

Prospects

- Retrieve efficiency
 - Loose selection criteria (e.g. momentum)
 - Include cases with K^*
 - Include neutrals using HCAL info
- ISR study
 - ISR analysis is already in progress
 - LPFO charged Kaon opening angle
 - Total visible energy
