

How to use KEK Guest Network System

1. Associate the wireless network using SSID and WPA2 key.

2. Open the web browser and enter URL <http://www.kek.jp/> .

The browser will redirect to the authentication page without showing the actual page. Some devices will show a dialog page for authentication before you manually start a web browser. It is caused by the automatic connectivity monitor in background.

3. Enter your name, institute, email address in your institute (free email services will be rejected), the event name, and the event password, and submit.

The screenshot shows a web browser window with the URL `https://las3.kek.jp:8443/gnauth/`. The page content includes a list of prohibited activities: "Using malware", "Infesting malware on other computers", and "Mass data transfer". Below this, there are instructions: "You have to obey the event administrators and system administrator." and "Please do not contact with the system administrator about the connectivity." The main form asks the user to "Please select the event name and enter your name, affiliation, e-mail address in your institute, the password for the selected event." The form fields are: "name", "affiliation", "your email address in affiliation", "event name", and "event password". A "agree to terms and use network" button is at the bottom. Two red callout boxes are present: one pointing to the "event name" field with the text "Event name : Down Selection Review on Crab Cavity Design", and another pointing to the "event password" field with the text "Event password : DSRCCD2023".

4. If your browser show "authentication success" message in black letters on white page, you can access Internet.
